

# Implementing Systems Engineering at the Brazilian Synchrotron: a Workflow for enhanced beamline design

Capella Days 2024

Gabriel Moreno, Cassiano Bueno, Debora Jesus

MARÉ Group, Beamline Eng. Division (DEL), Sirius/CNPEM

MINISTÉRIO DA  
CIÊNCIA, TECNOLOGIA  
E INOVAÇÃO

# Summary

- Who are we? What we do?
- Our Capella-based systems engineering workflow
- Which softwares are we integrating with Capella?

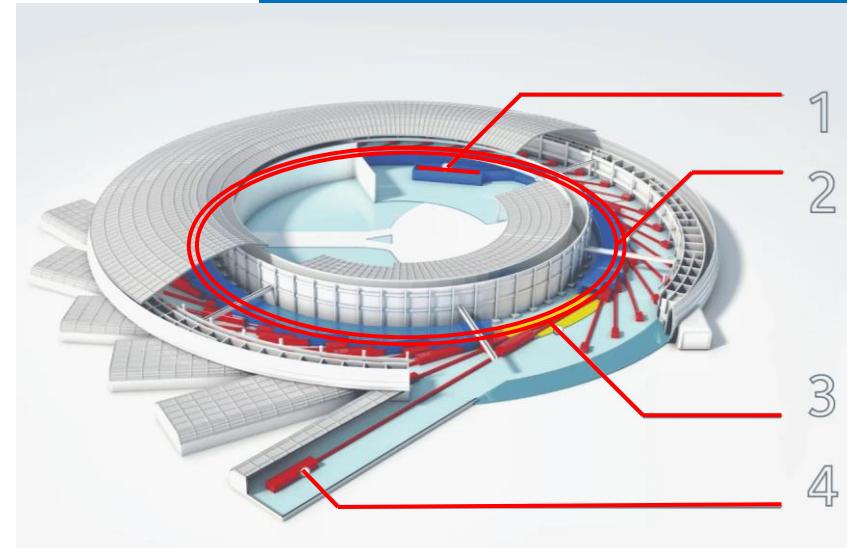

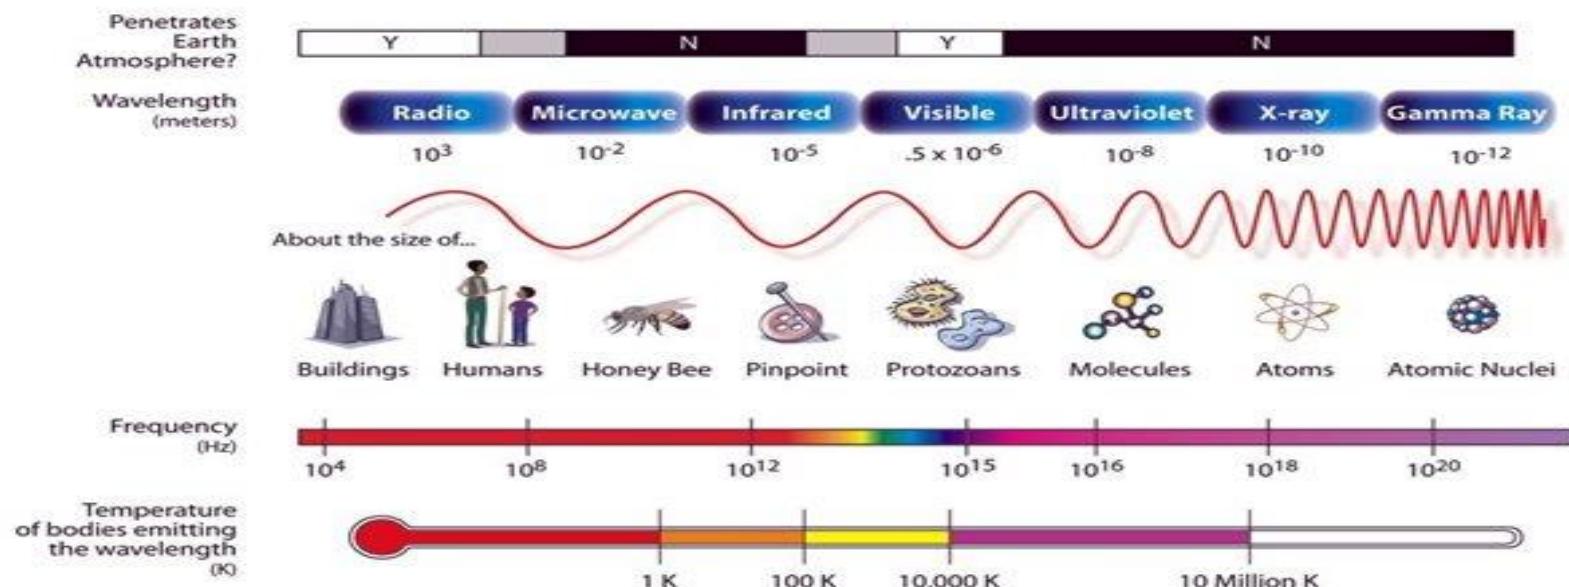

# Context

# Synchrotron Laboratories

In essence, giant and powerful microscopes!

- Large scientific infrastructure that produces a broad-spectrum light, used to investigate the structure of materials and their interactions in high resolution
- Recently upgraded to 4<sup>th</sup> generation, granting better imaging capabilities at its beamlines

## THE ELECTROMAGNETIC SPECTRUM

- 1 – Linear Accelerator (LINAC)
- 2 – Injecting Accelerator (Booster)
- 3 – Main Accelerator (Storage Ring)
- 4 – Experim. Stations (Beamlines)

# 4<sup>th</sup> Generation Synchrotron Labs

## Recent greenfield or upgraded facilities

- Upgraded magnet arrangement for granting better light properties through better electron focalization and trajectory stability (~100-1000x gain from previous generations!!)

### SIRIUS

Energy 3.0 GeV  
Circumference 518 m

Campinas

### HEPS (construction)

Energy 6.0 GeV  
Circumference 1360 m

### APS-U

Energy 6.0 GeV  
Circumference 1103 m

### MAX IV

Energy 3.0 GeV  
Circumference 528 m

### ESRF-EBS

Energy 6.0 GeV  
Circumference 844 m

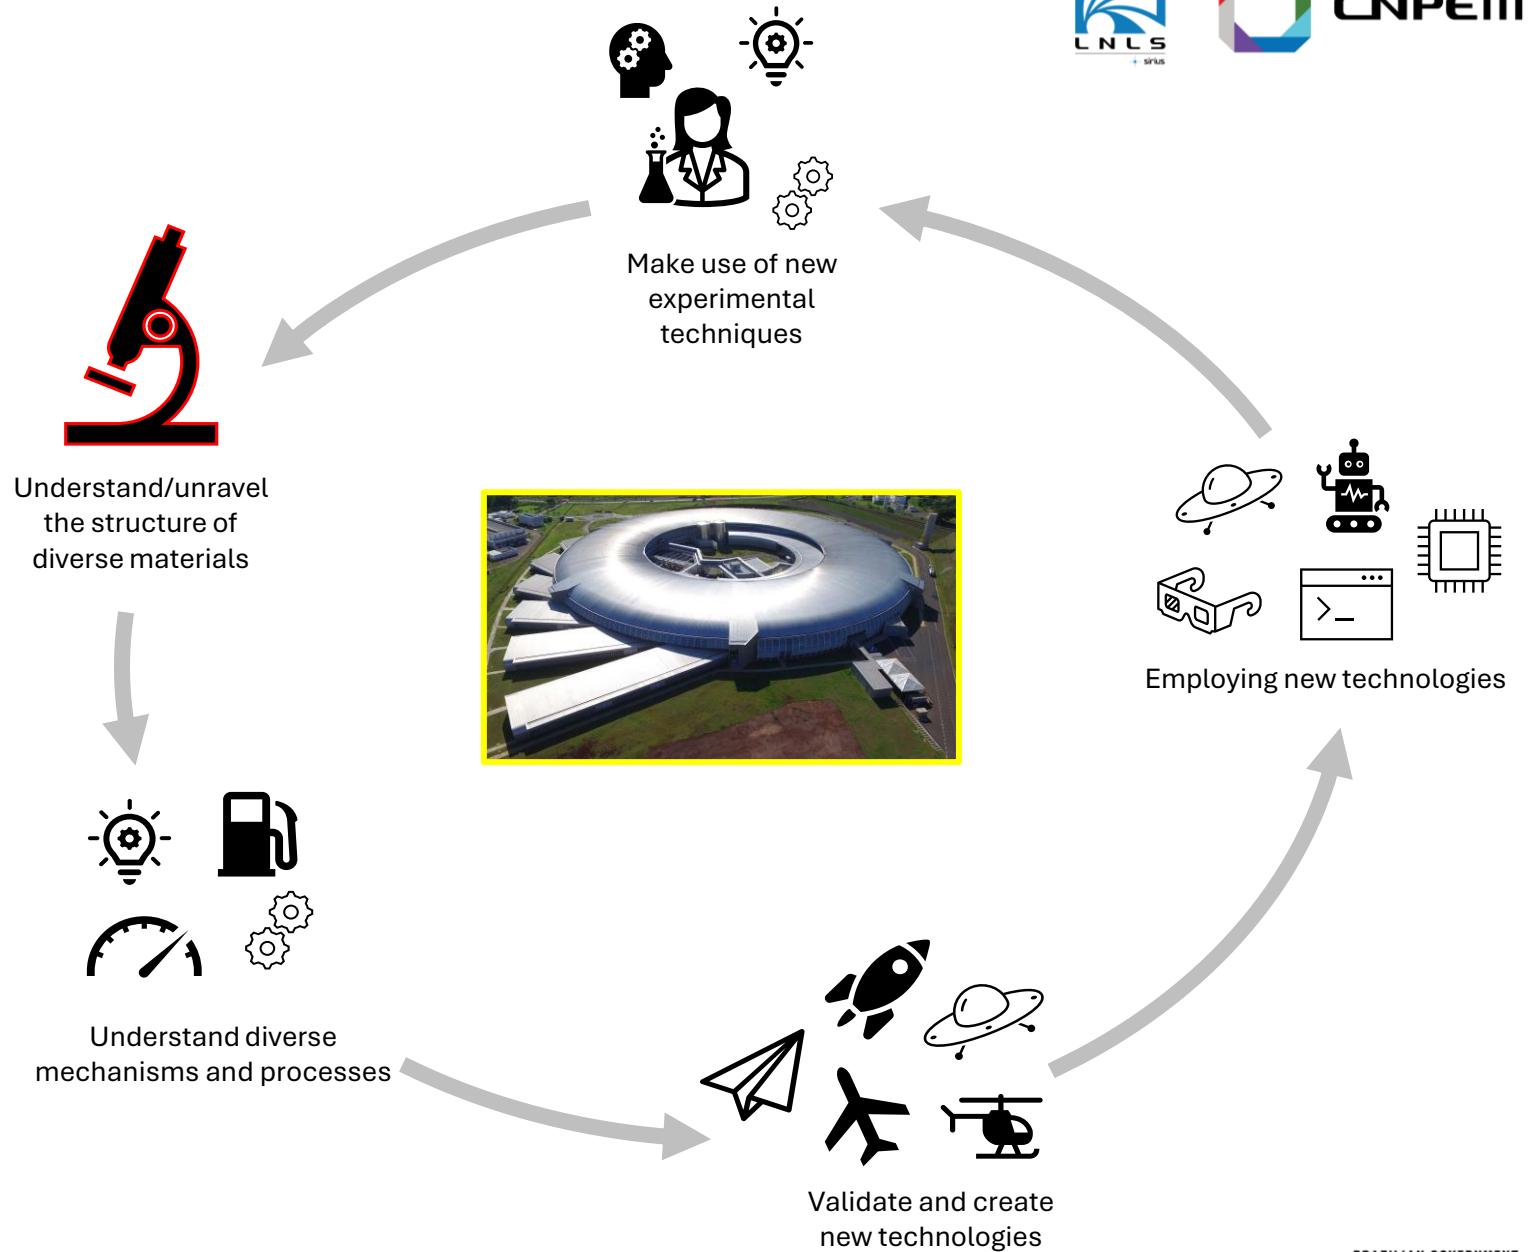

### SLS2 (construction)

Energy 2.4 GeV  
Circumference 290 m

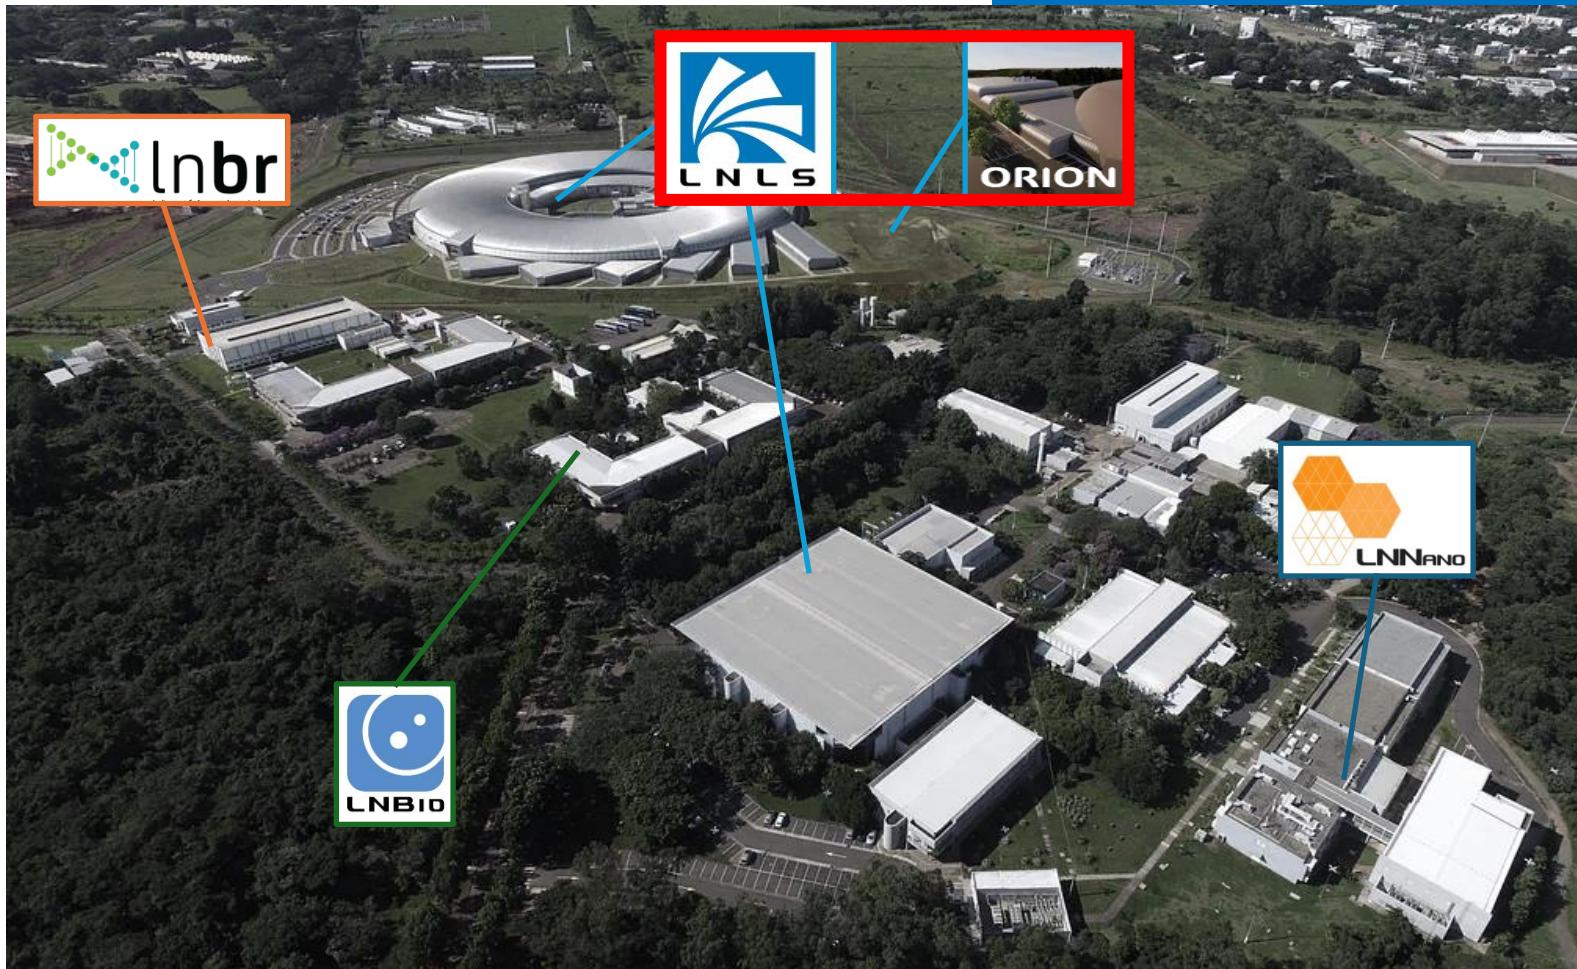

# Sirius/LNLS Mission

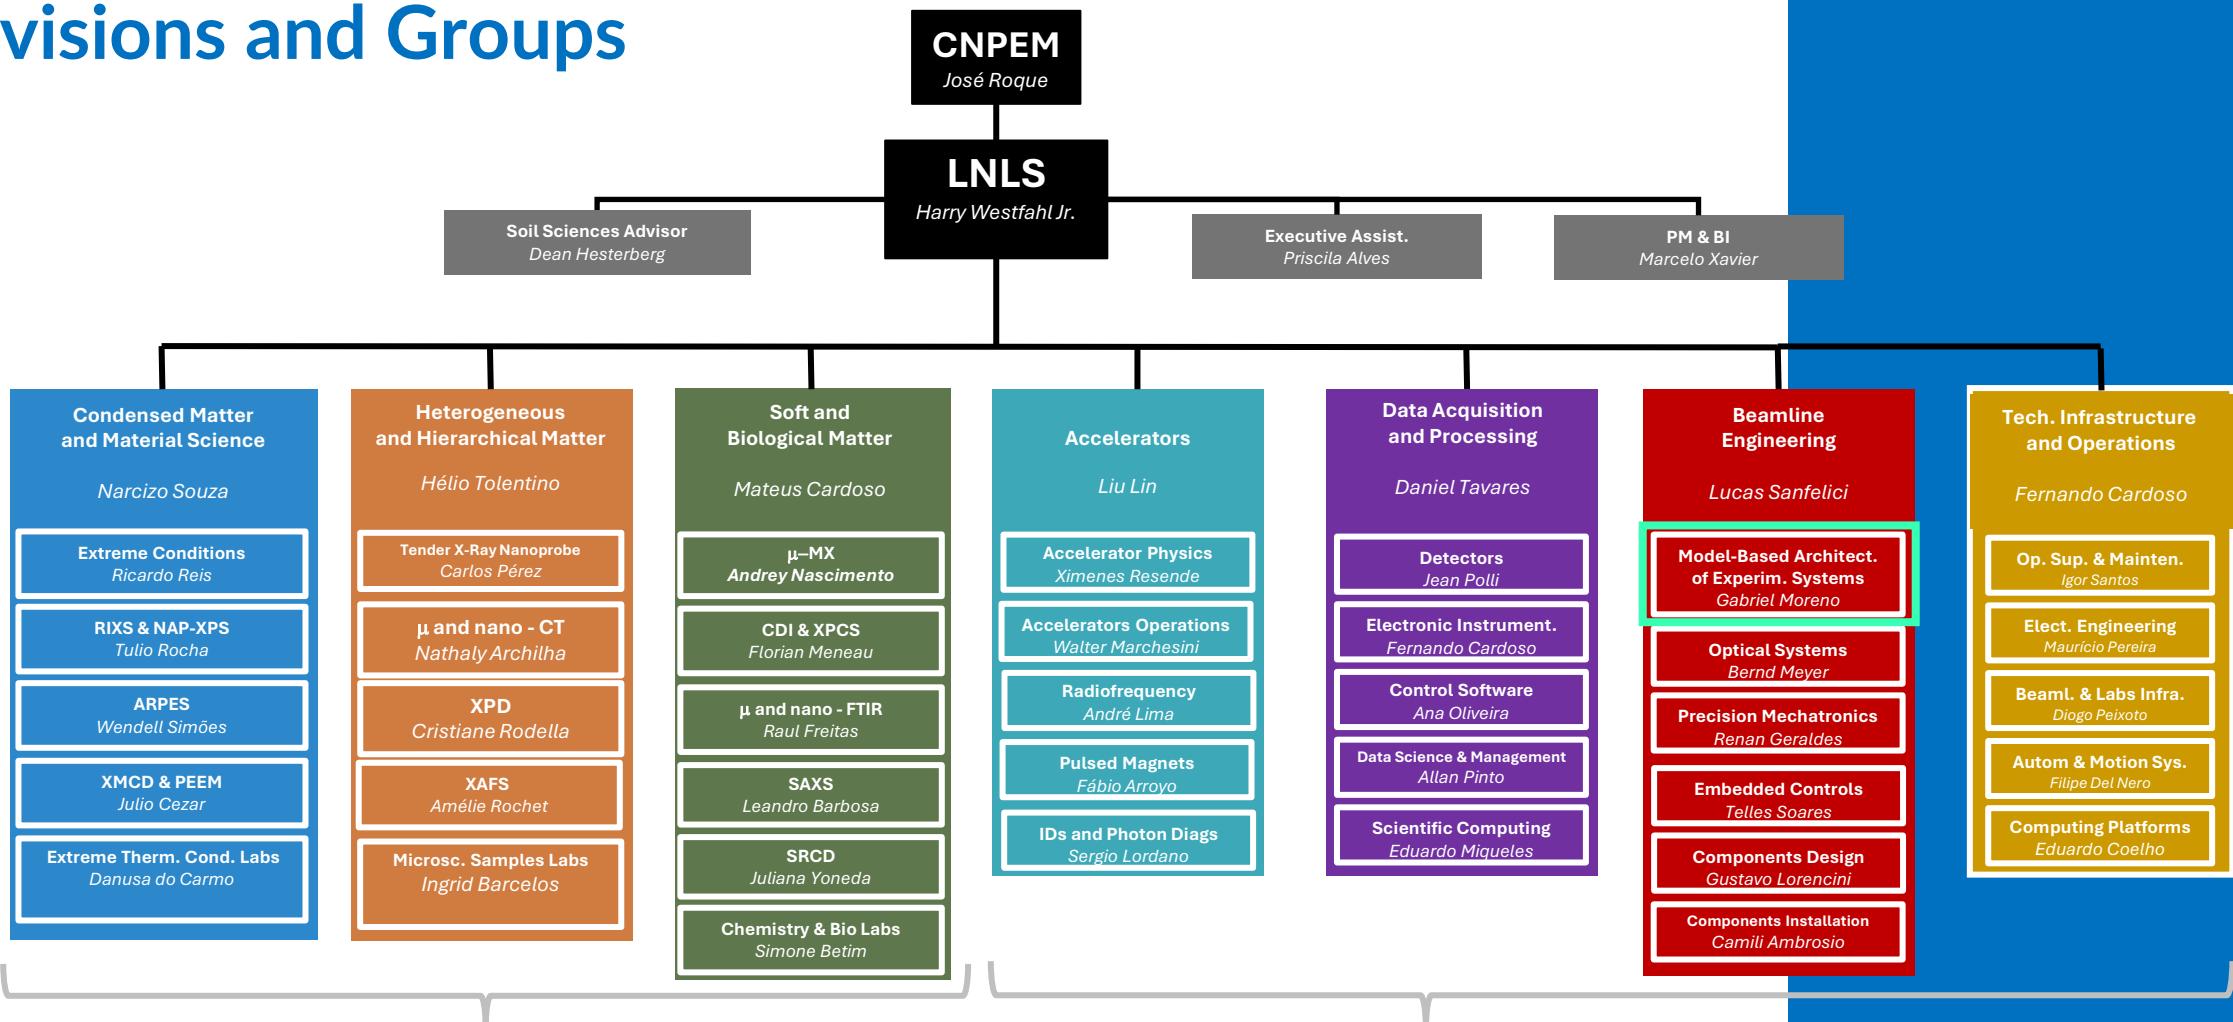

- Not the Obeo Eclipse tool, but a particle accelerator instead! 😊
- 2nd Synchrotron Laboratory in Brazil, replacing the 1st one (UVX: 1989-2019)
- One of the brightest lightsources in the world, having only 3 other comparable at the moment (all in Northern Hemisphere)
- Research facility open to users worldwide

- **CNPEM**
  - Brazil's National Center for Research in Energy and Materials – CNPEM
- **4+1 National Labs**
  - LNLS/Sirius – Synchrotron Lightsource
  - LNBR – Bio-renewables
  - LNBio – Biosciences
  - LNNano – Nanotechnology
  - LNPP/Orion – Max. Biosafety (construction)
- **Beamlane Eng. Division (DEL)**
  - MArÉ Group – Modeling and Architecture of Experimental Systems

# Sirius/LNLS People

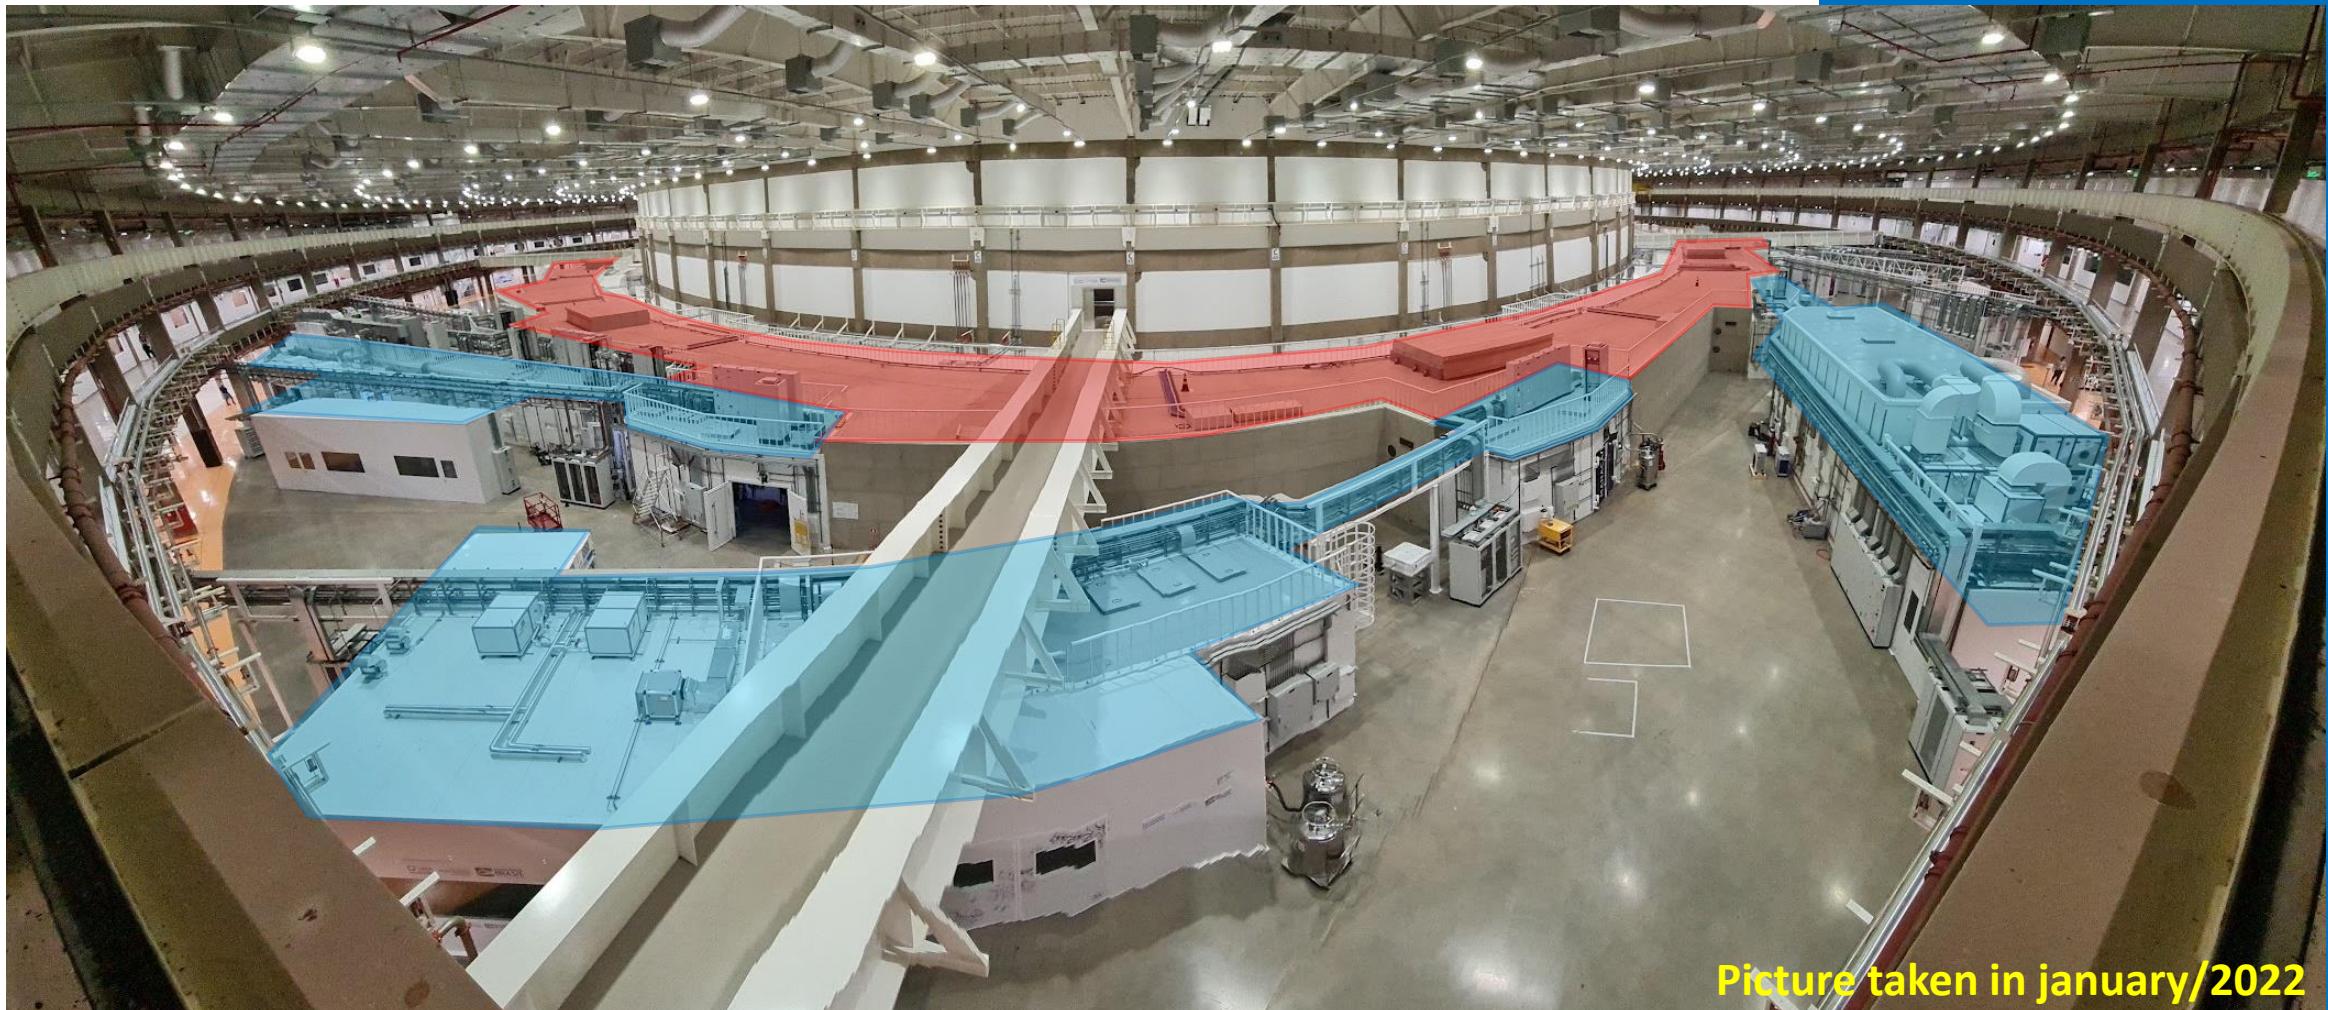

## Divisions and Groups

# Beamline Design

- Scientific groups work together to create experiments that meet industry and scientific community needs
- Engineering groups work together to create instruments that meet scientific/experimental needs
- Synchrotron Beamlines are custom-built to address a specific group of techniques, designed to extract specific information from the analyzed materials
- A synchrotron lab may host dozens of Beamlines, all working simultaneously

# Sirius Beamlines

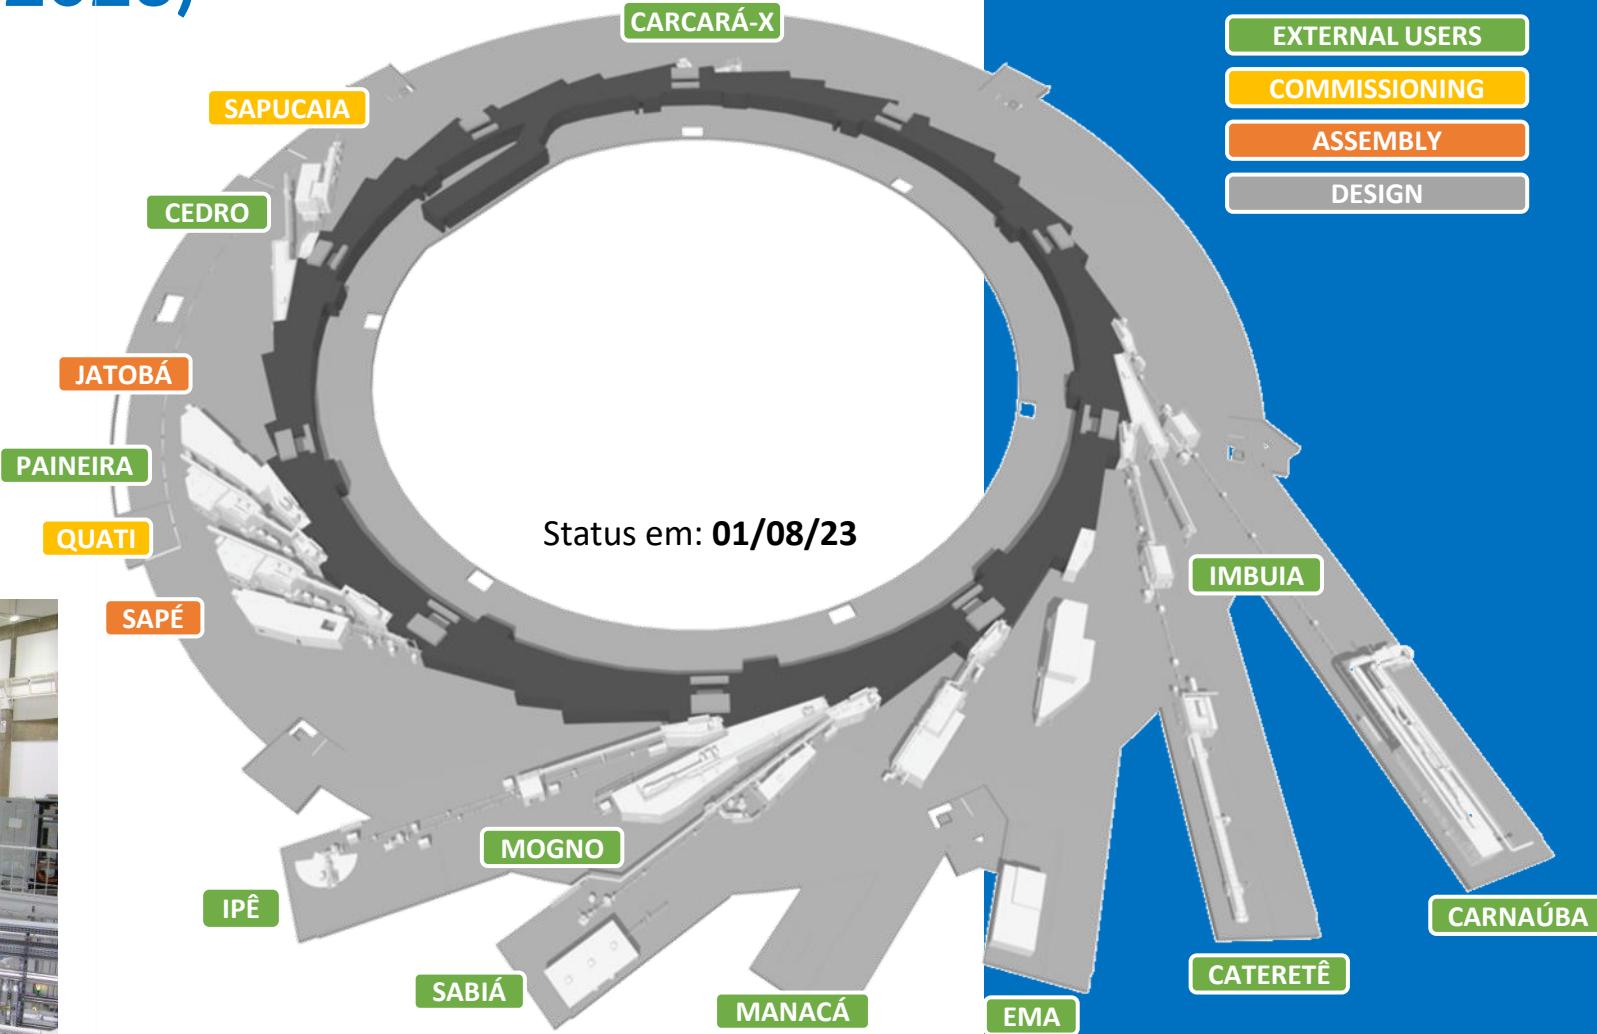

Picture taken in january/2022

# Sirius Beamlines

## Phase I beamlines (2019 – 2023)

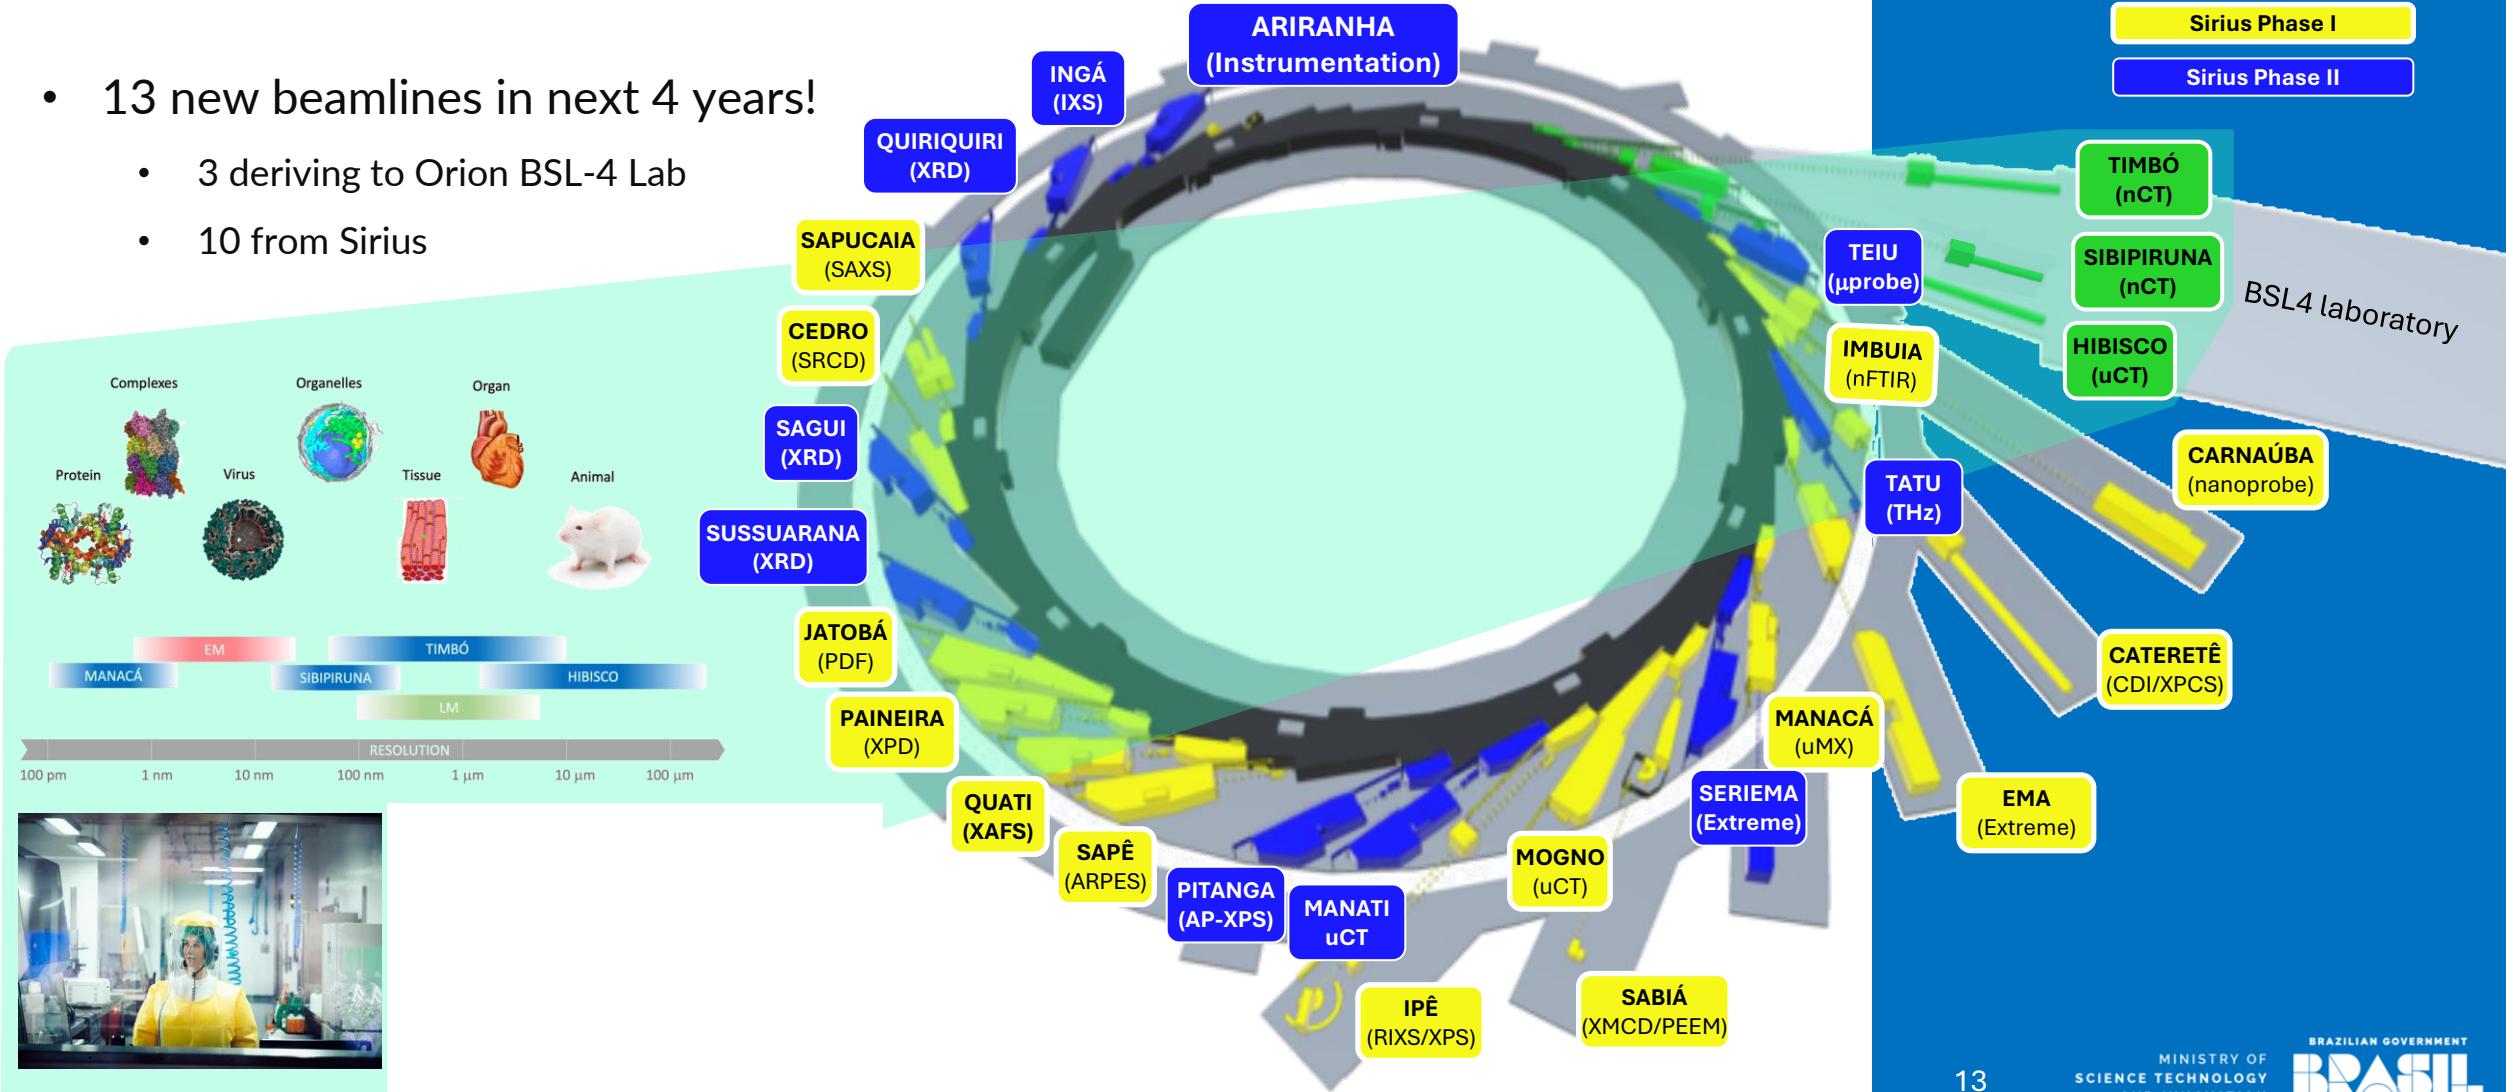

- 15 beamlines built in ~4 years!
  - 11 currently open to users
  - 2 in commissioning phase
  - 2 in assembly and installation phase

# Sirius Beamlines

## Phase II beamlines (2024 – 2028)

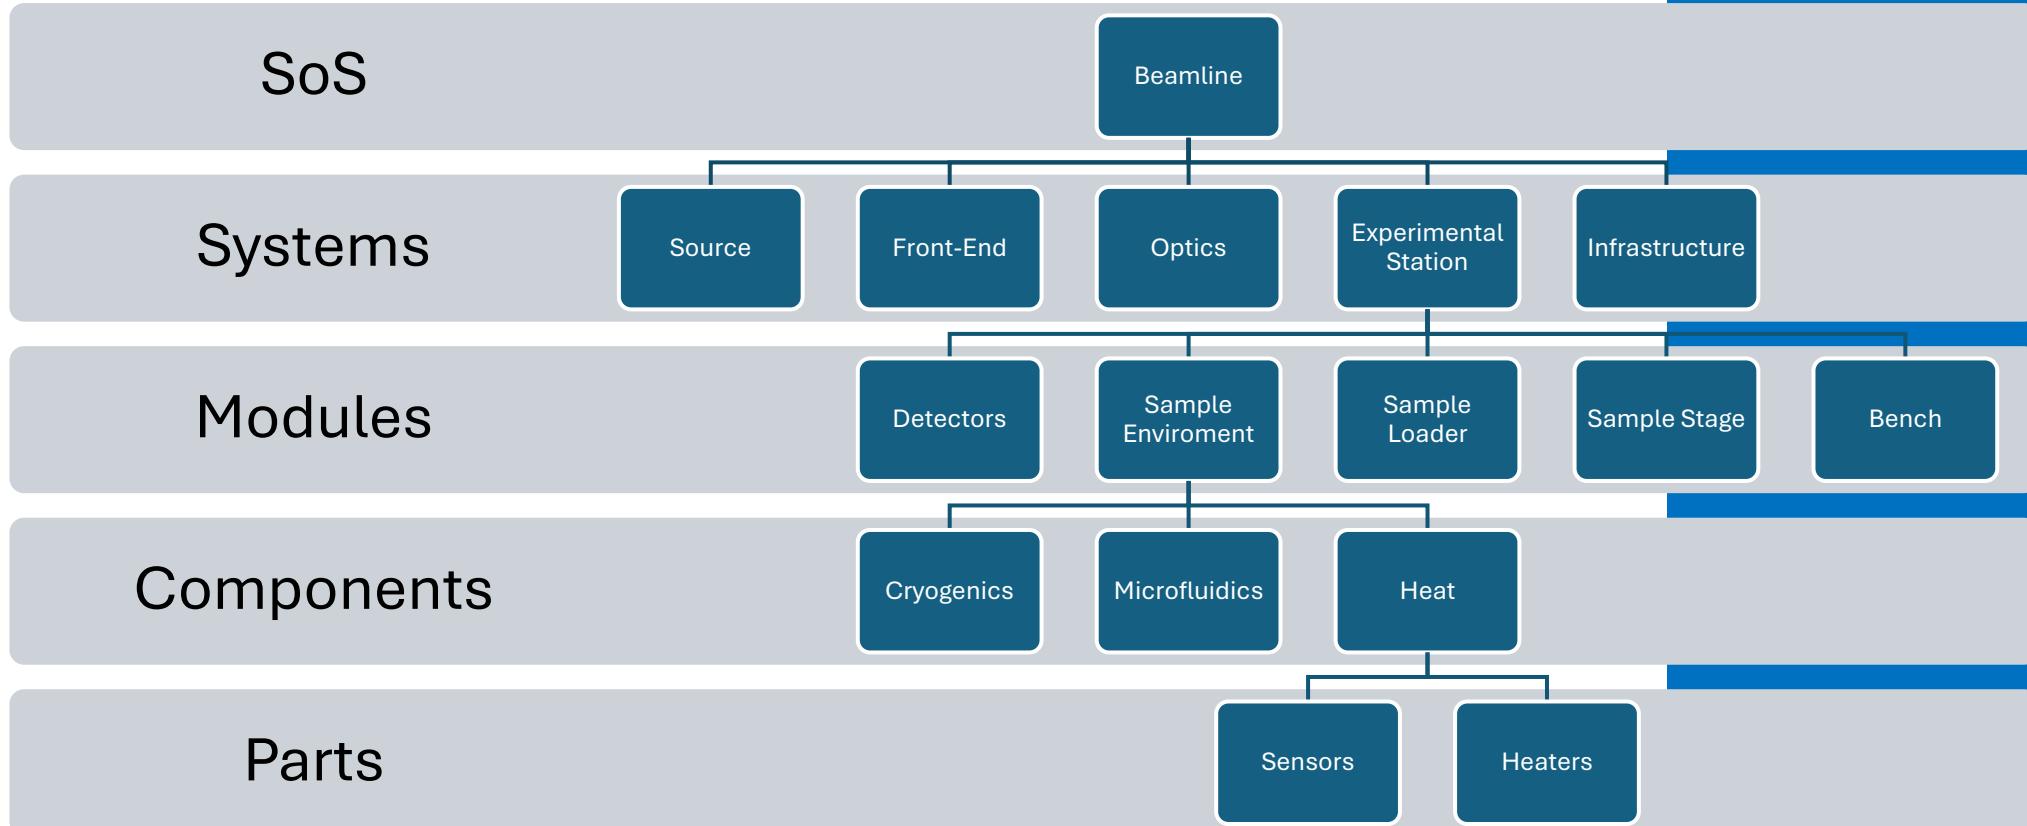

- 13 new beamlines in next 4 years!
  - 3 deriving to Orion BSL-4 Lab
  - 10 from Sirius

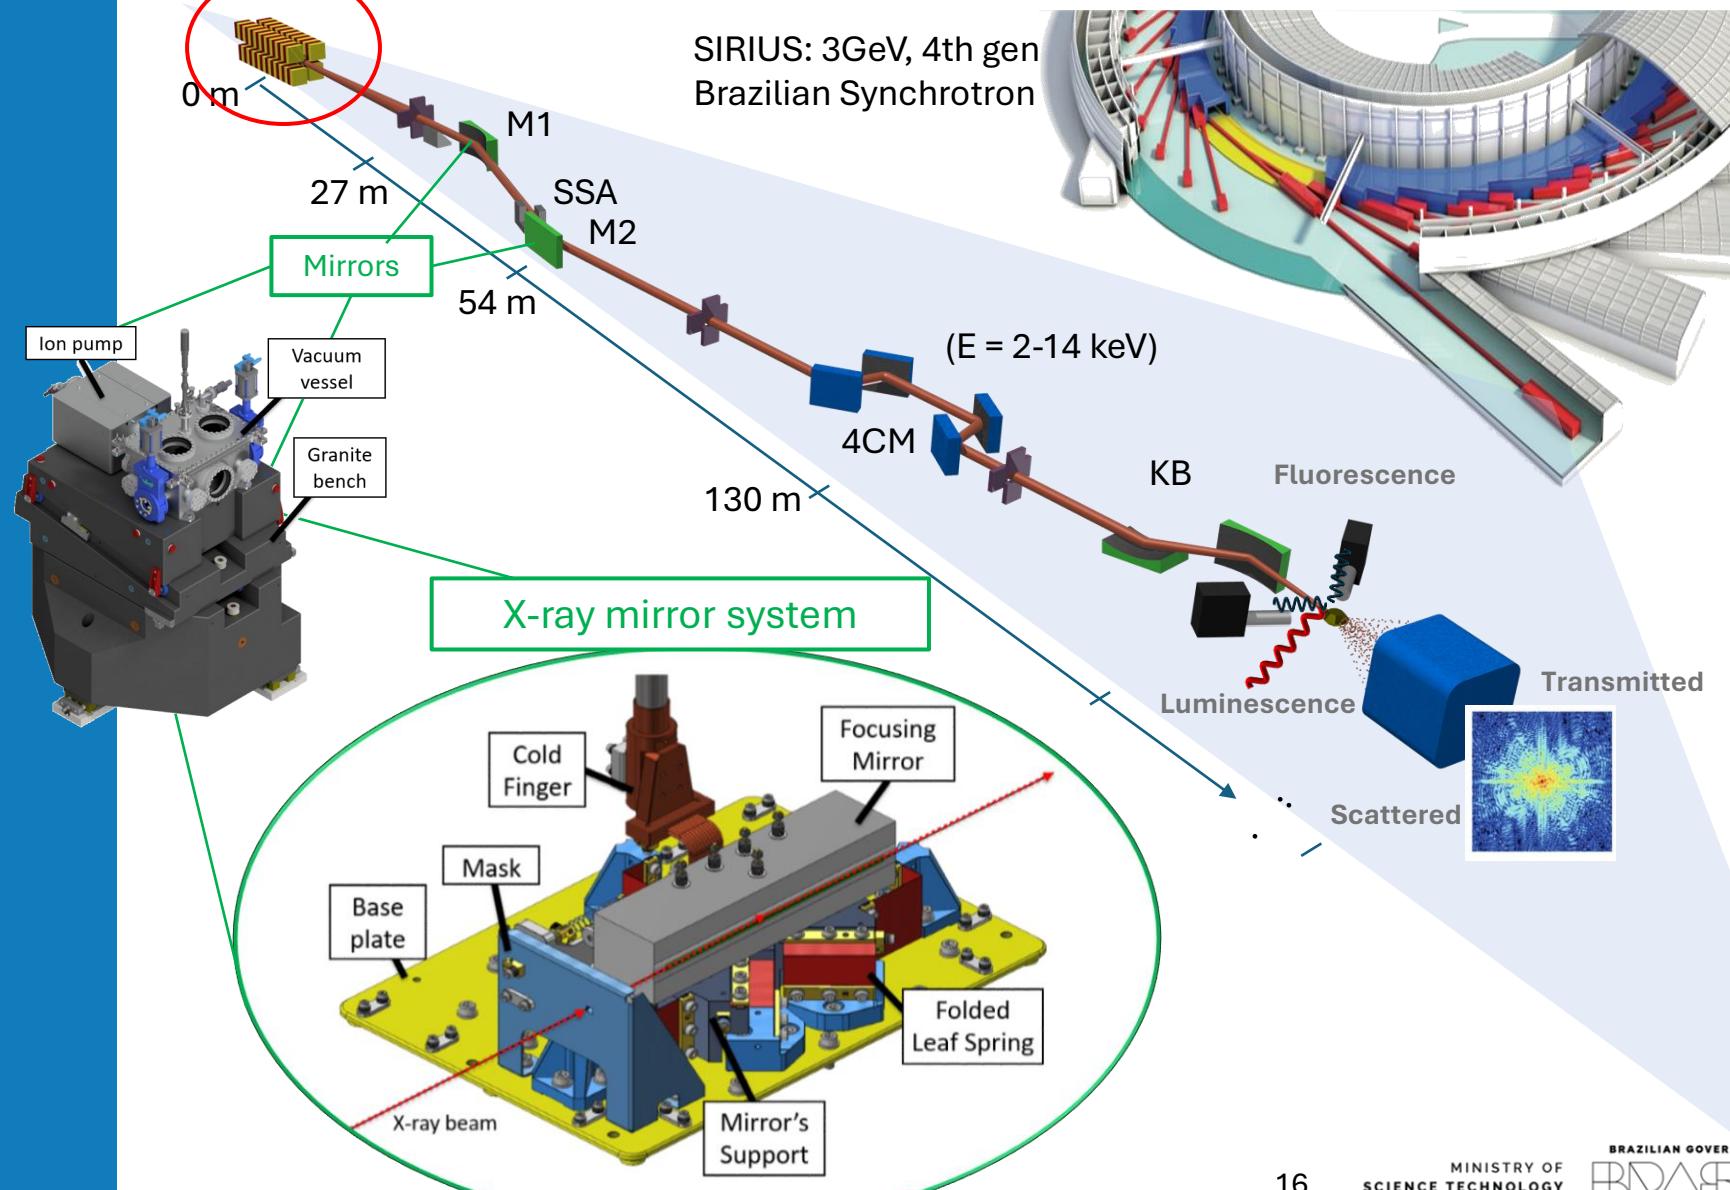

# Beamline concept and complexity

# What is a beamline?

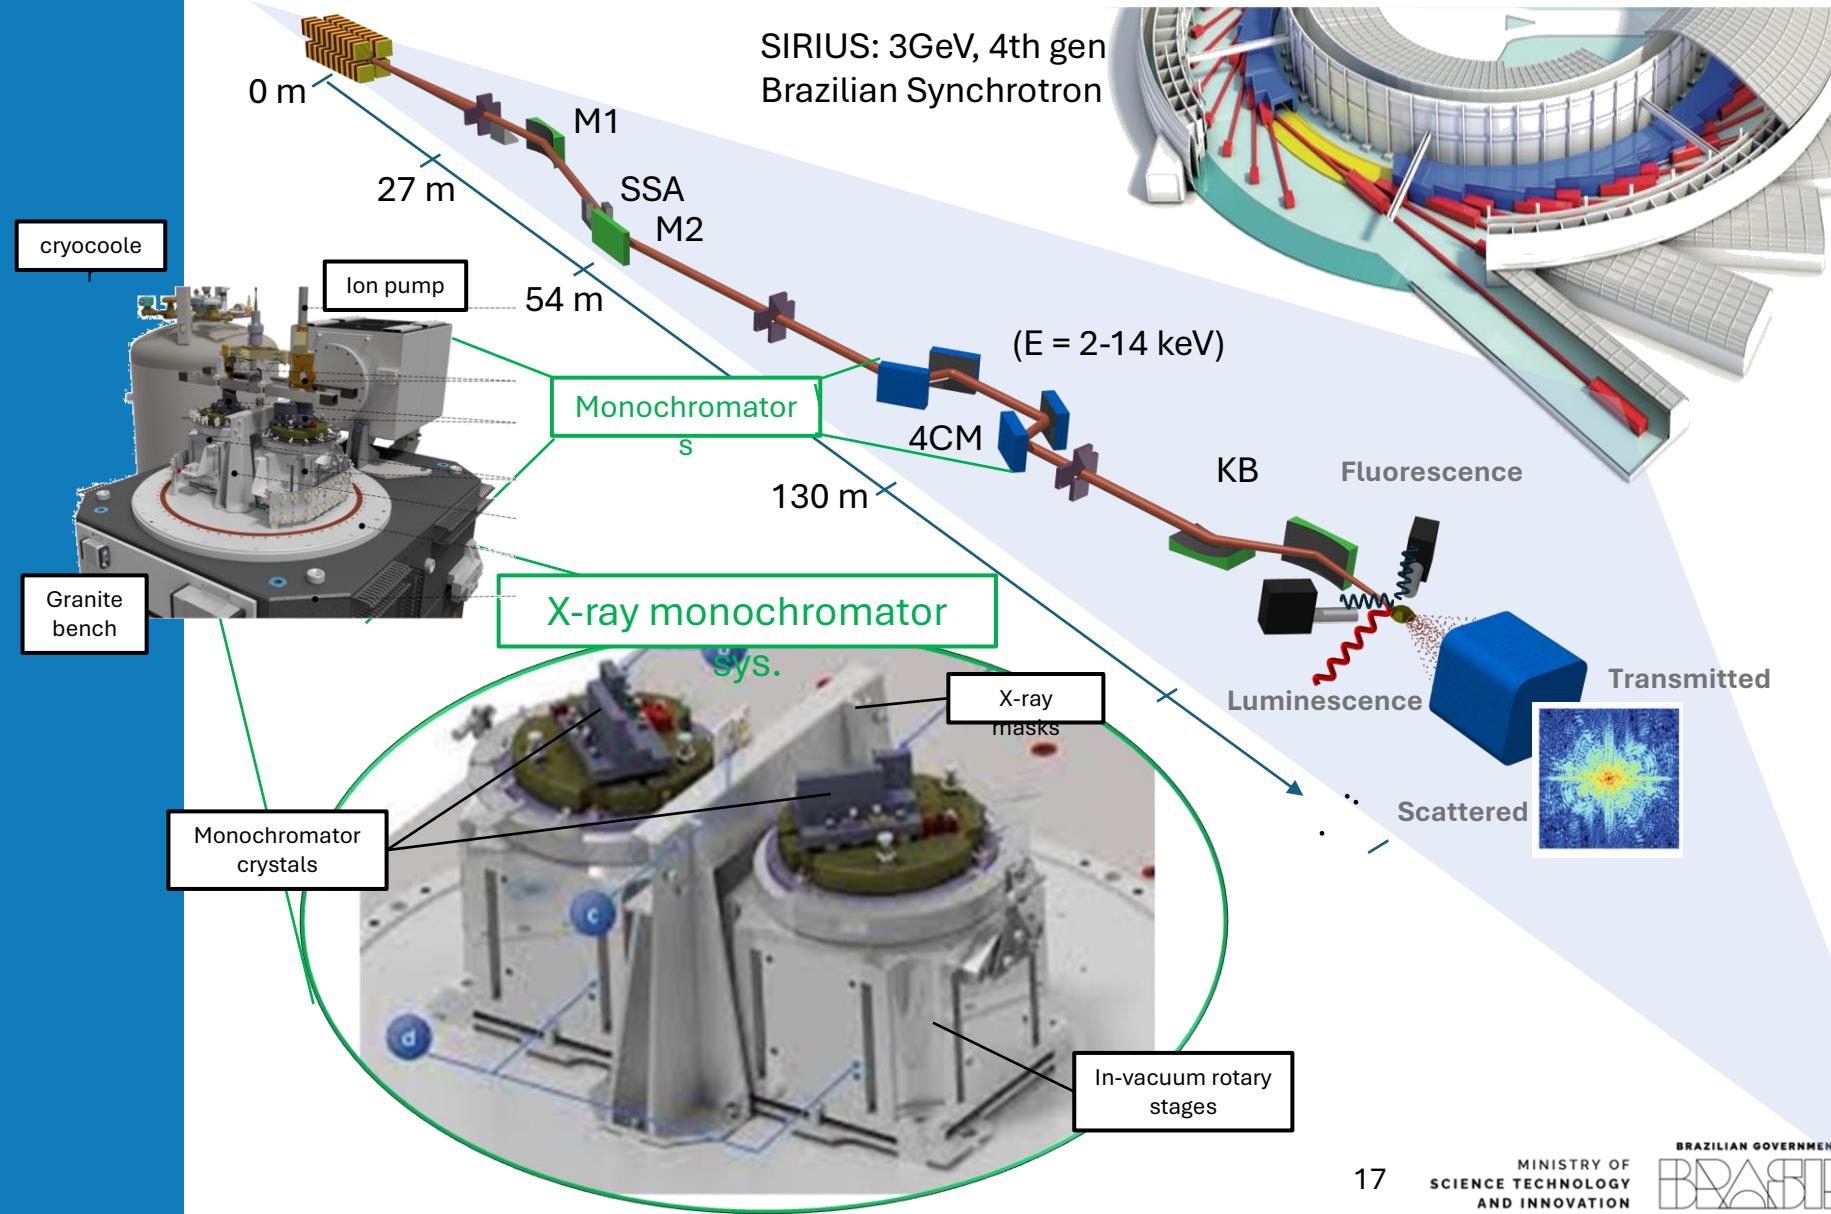

## Common System decomposition

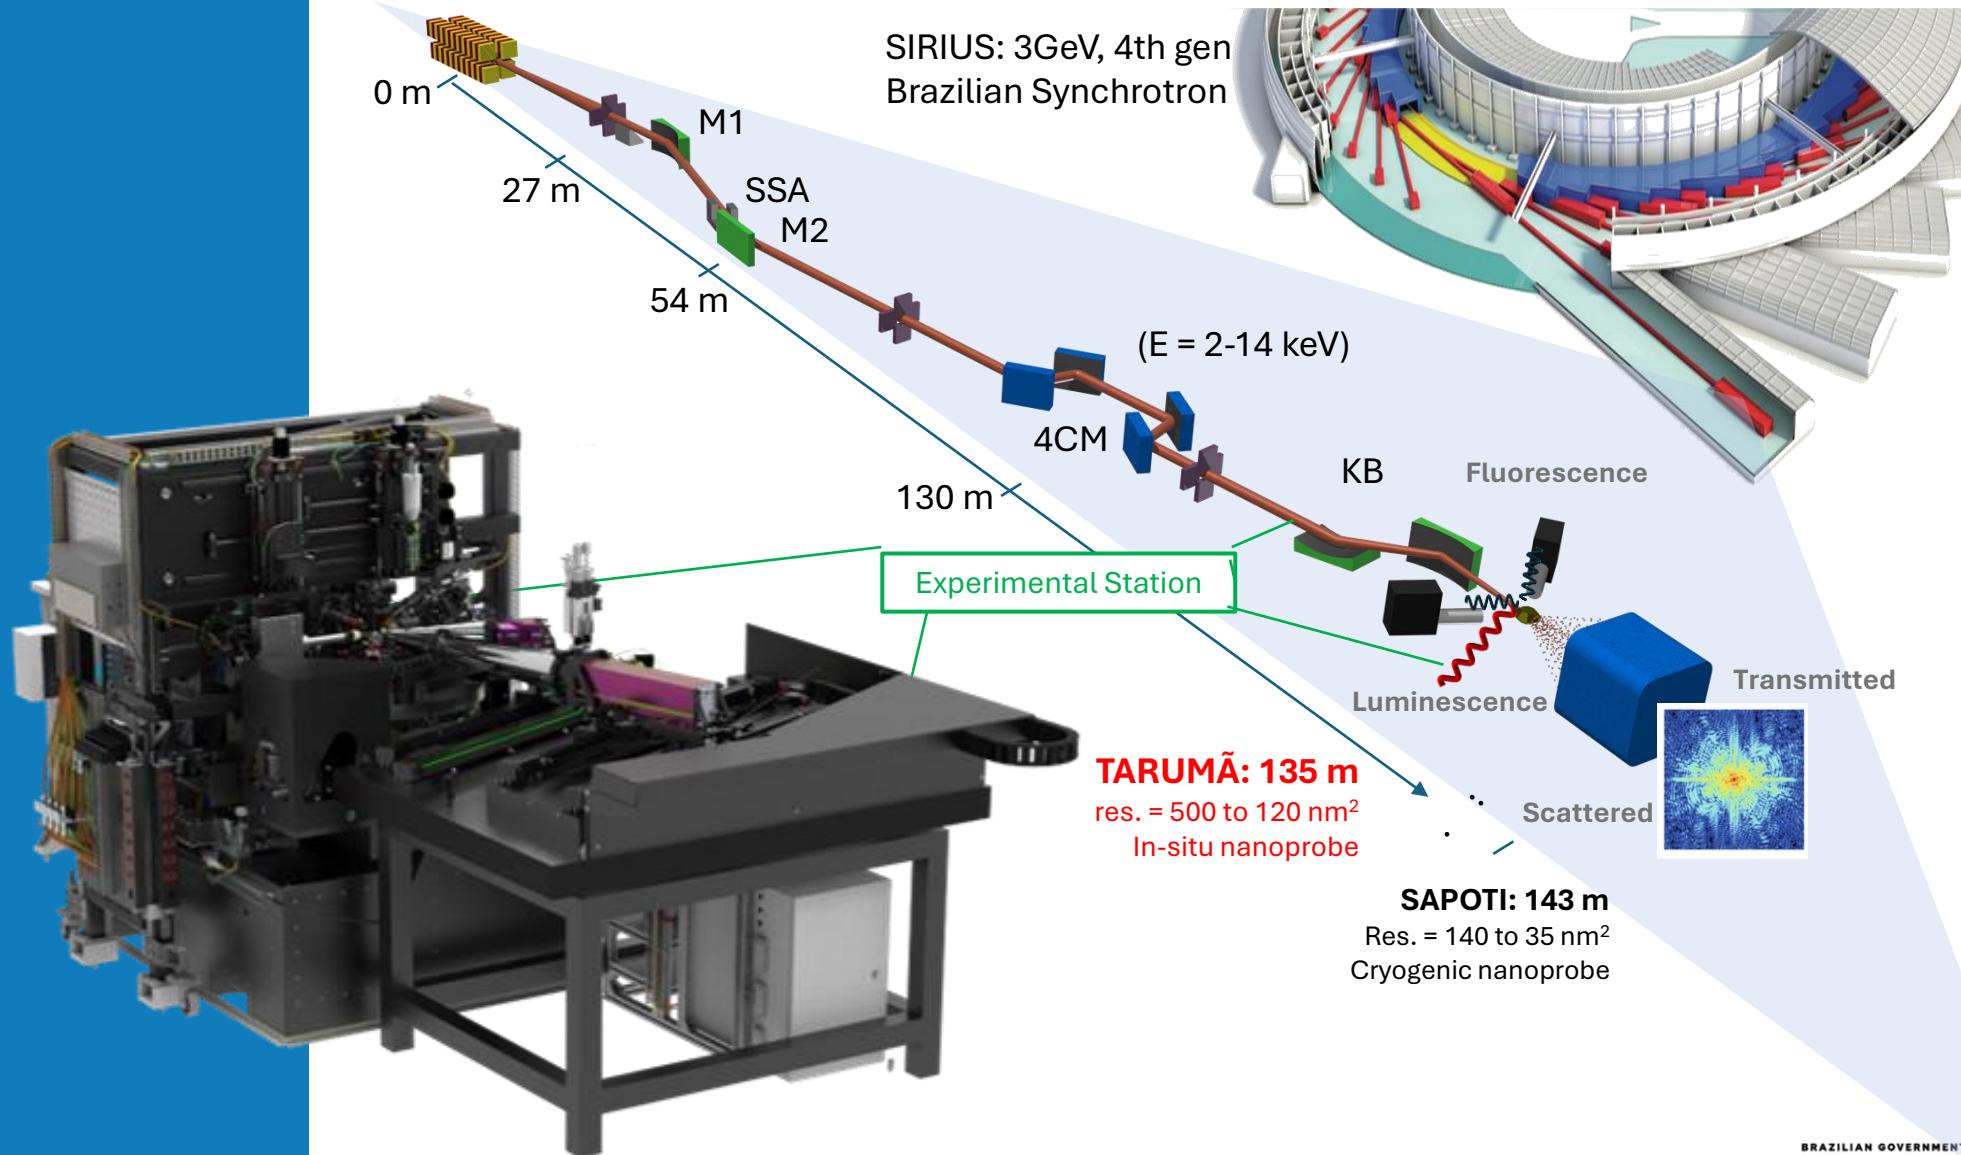

# What is a beamline?

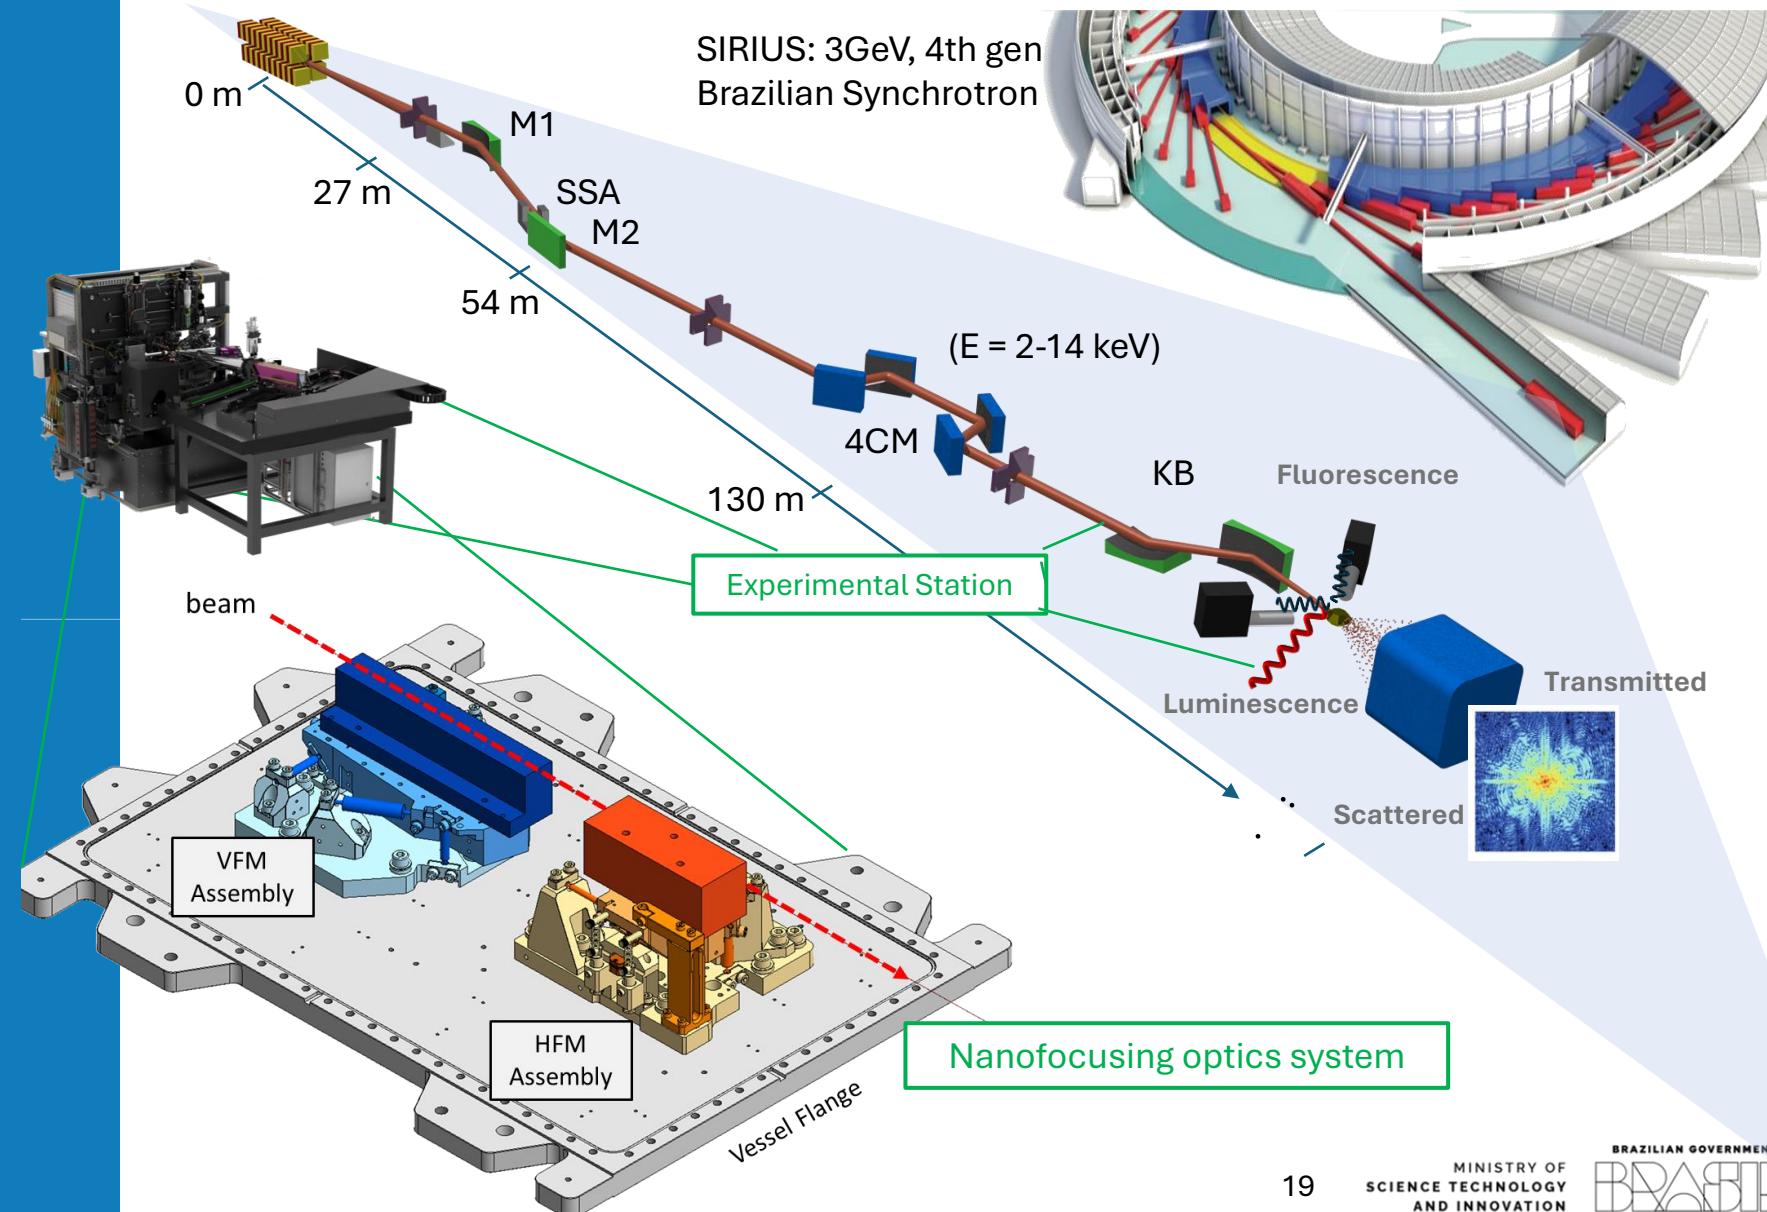

# What is a beamline?

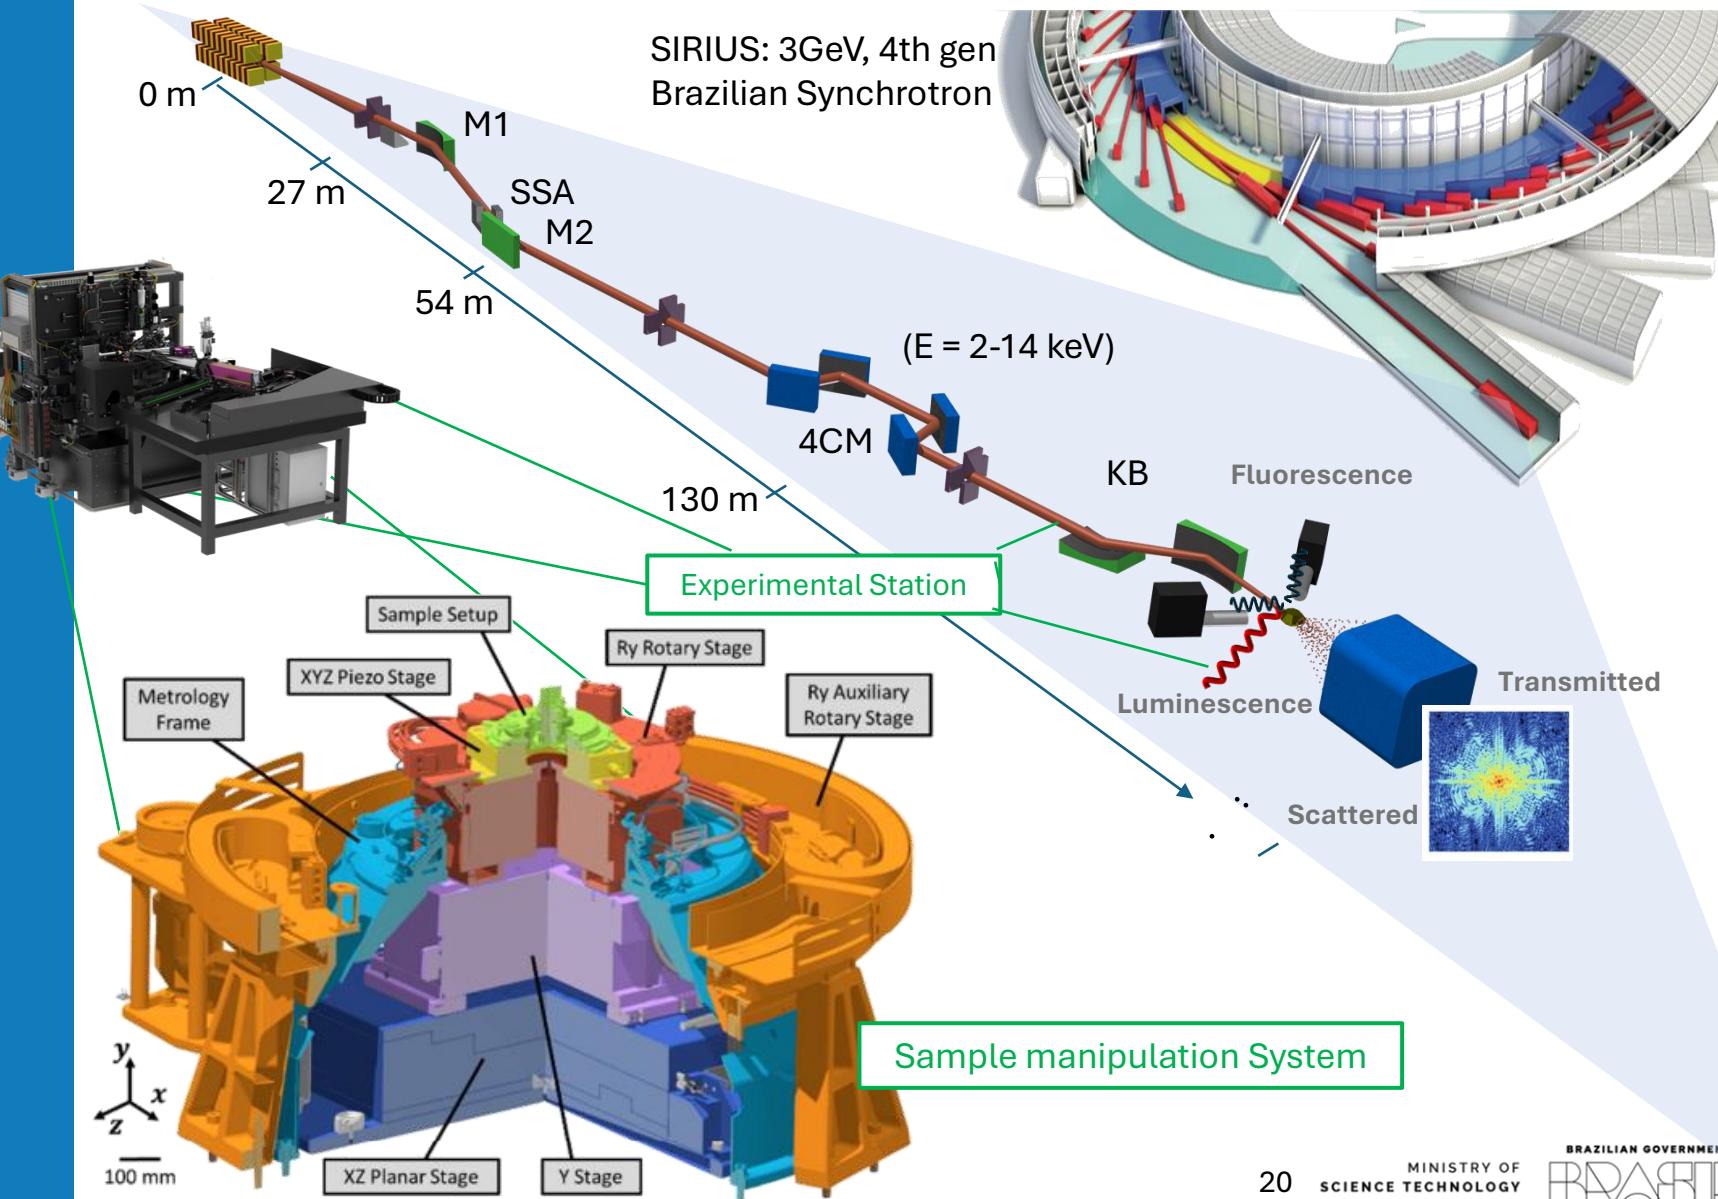

# What is a beamline?

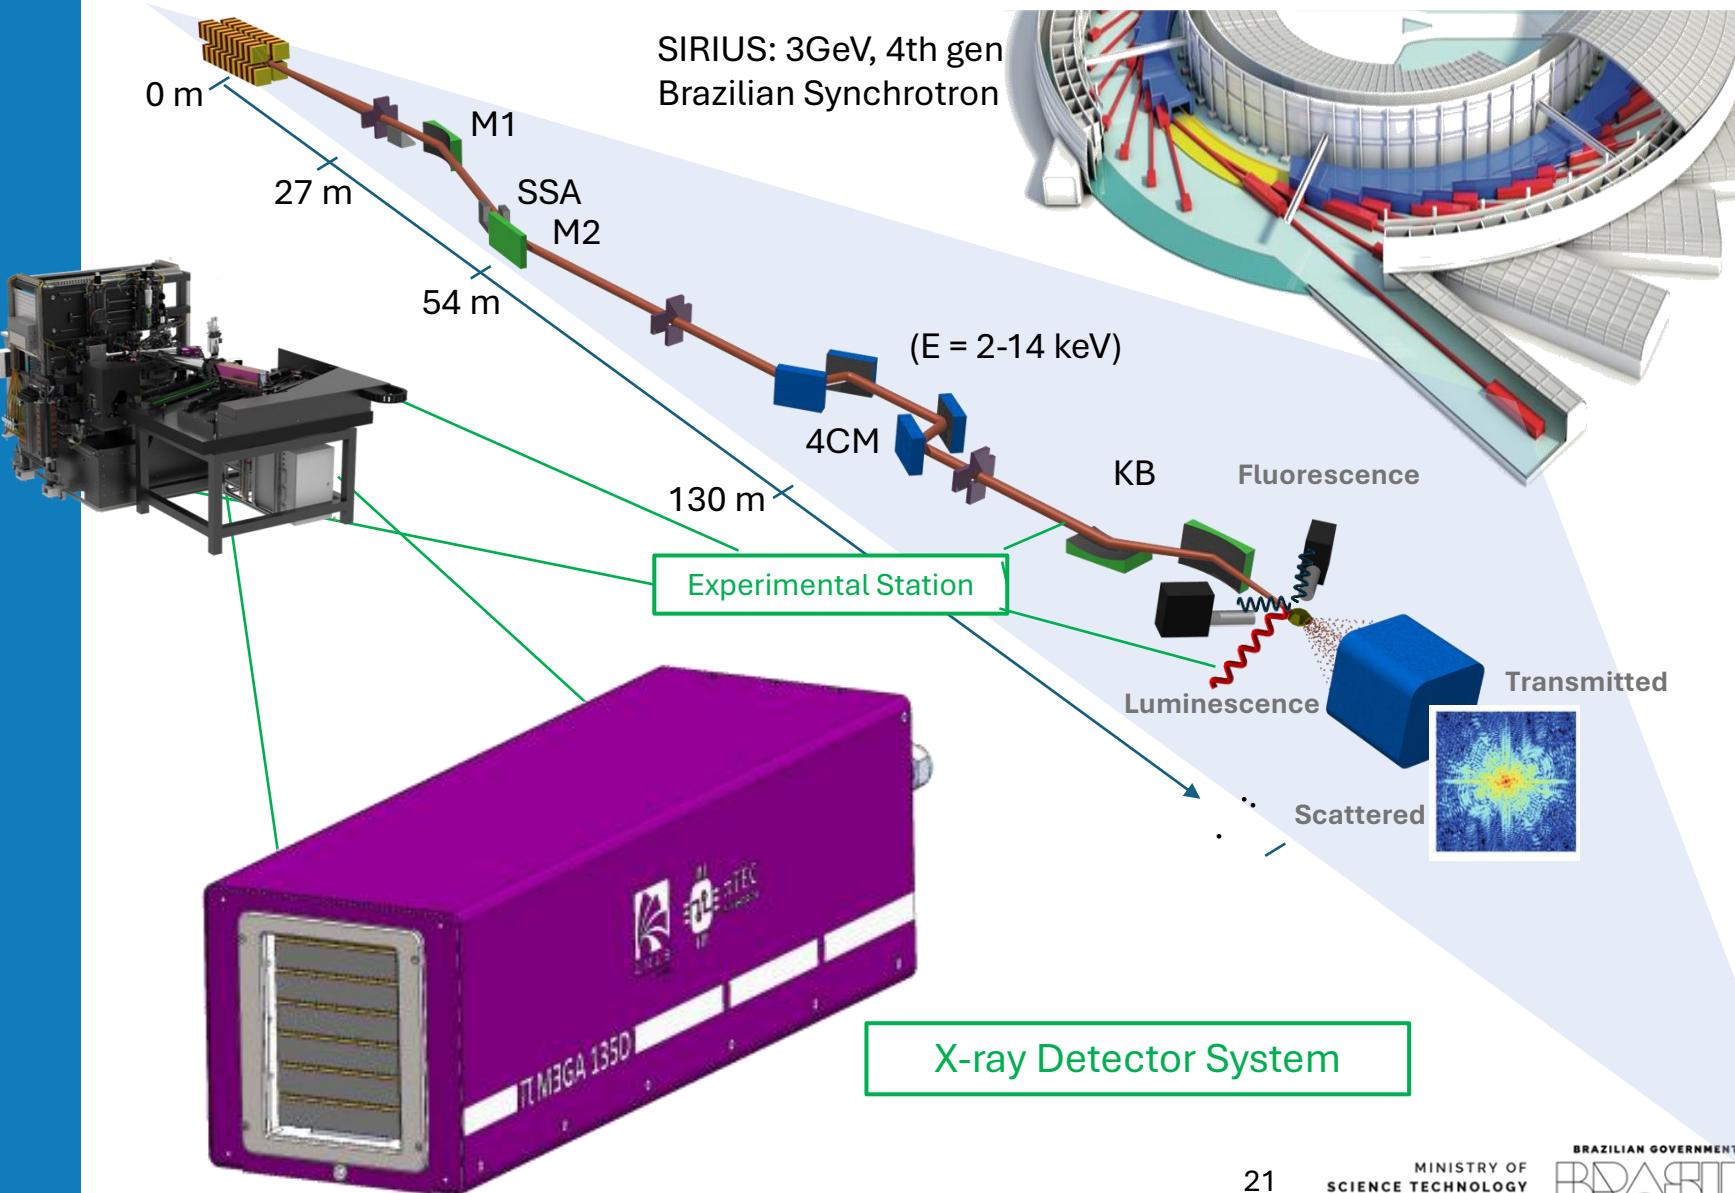

# What is a beamline?

# What is a beamline?

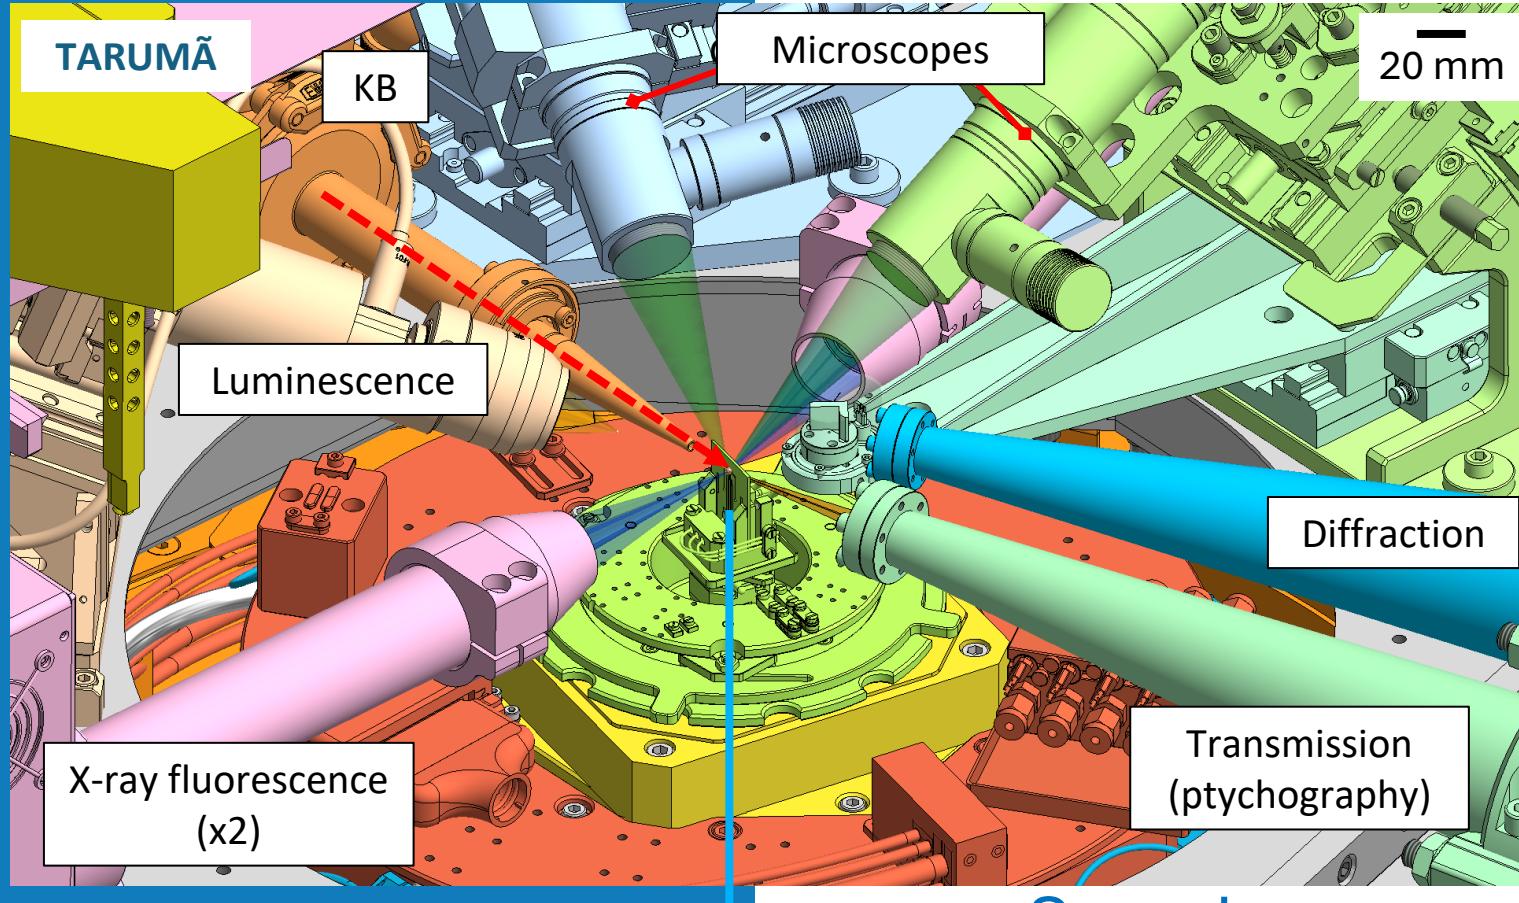

# What is a beamline?

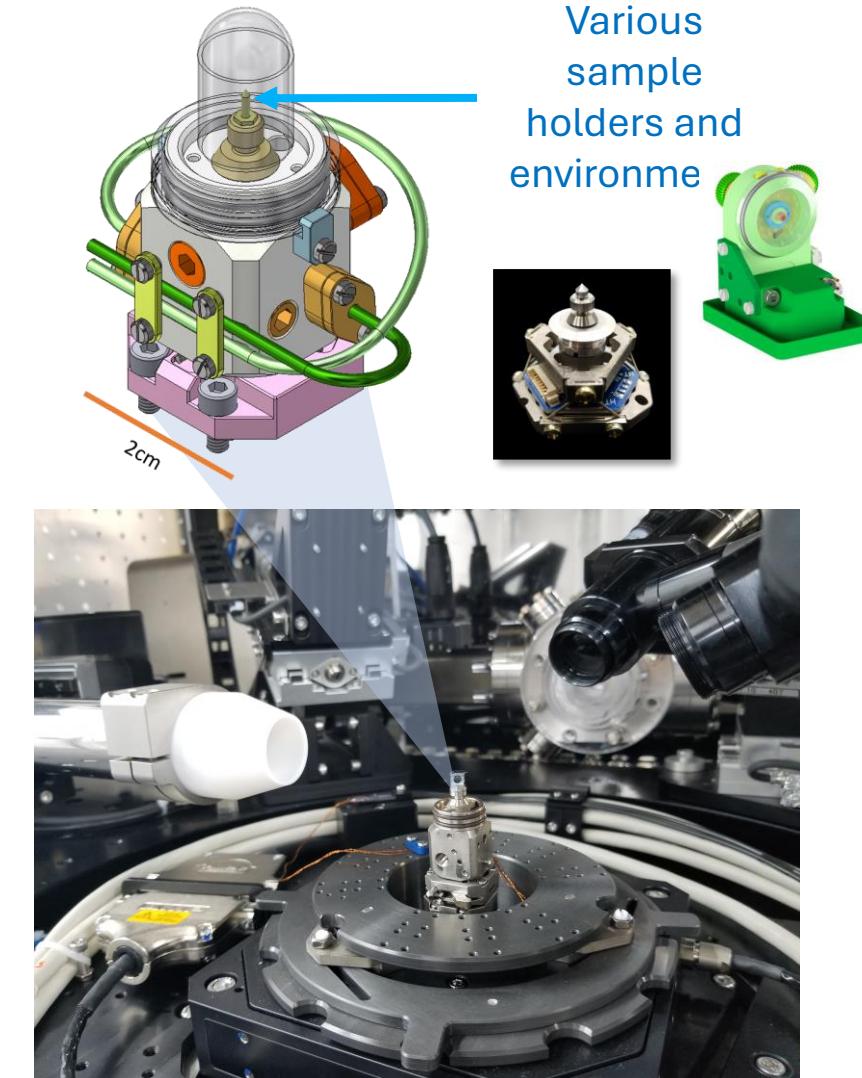

# TARUMÃ Station

- Multi-technique – experiments *in situ*, *in operando*, *in vivo*

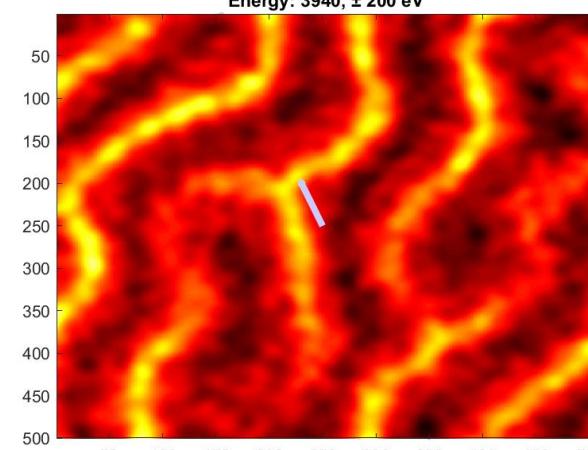

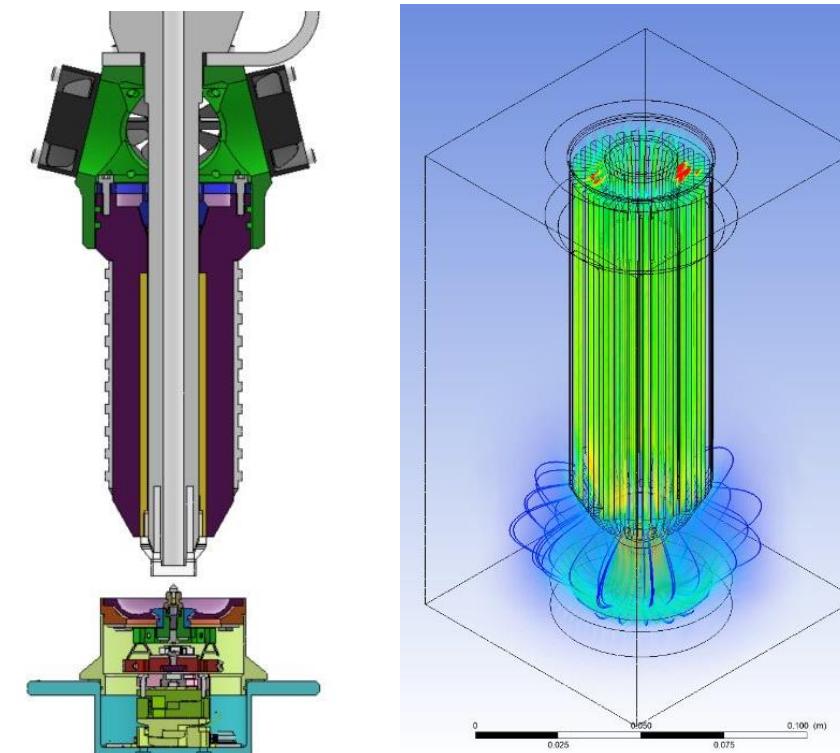

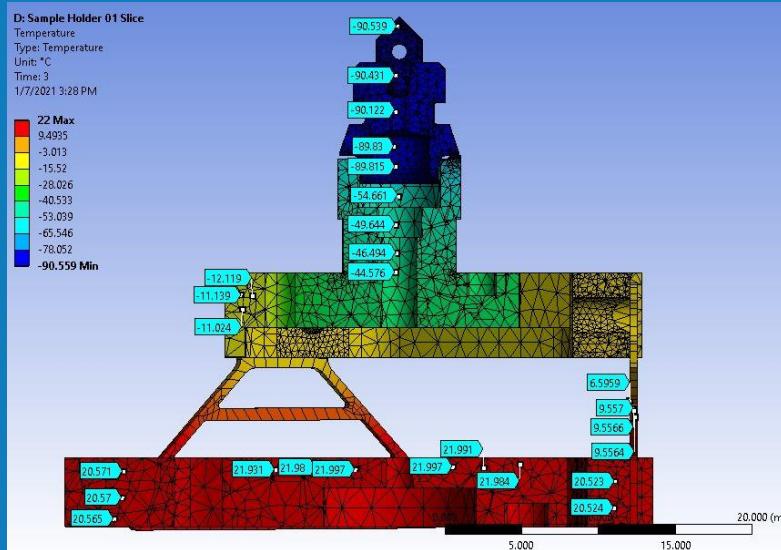

Samples  
(Biological, agro, minerals,  
batteries...)

# TARUMĀ Station

# Cryogenic Setup

- Sample temperature target: 122K
  - Thermal variations must cause minimal sample displacement (<30nm RMS)
  - Must insulate internal dry N<sub>2</sub> from atmospheric air
  - Must actively avoid water condensation/icing

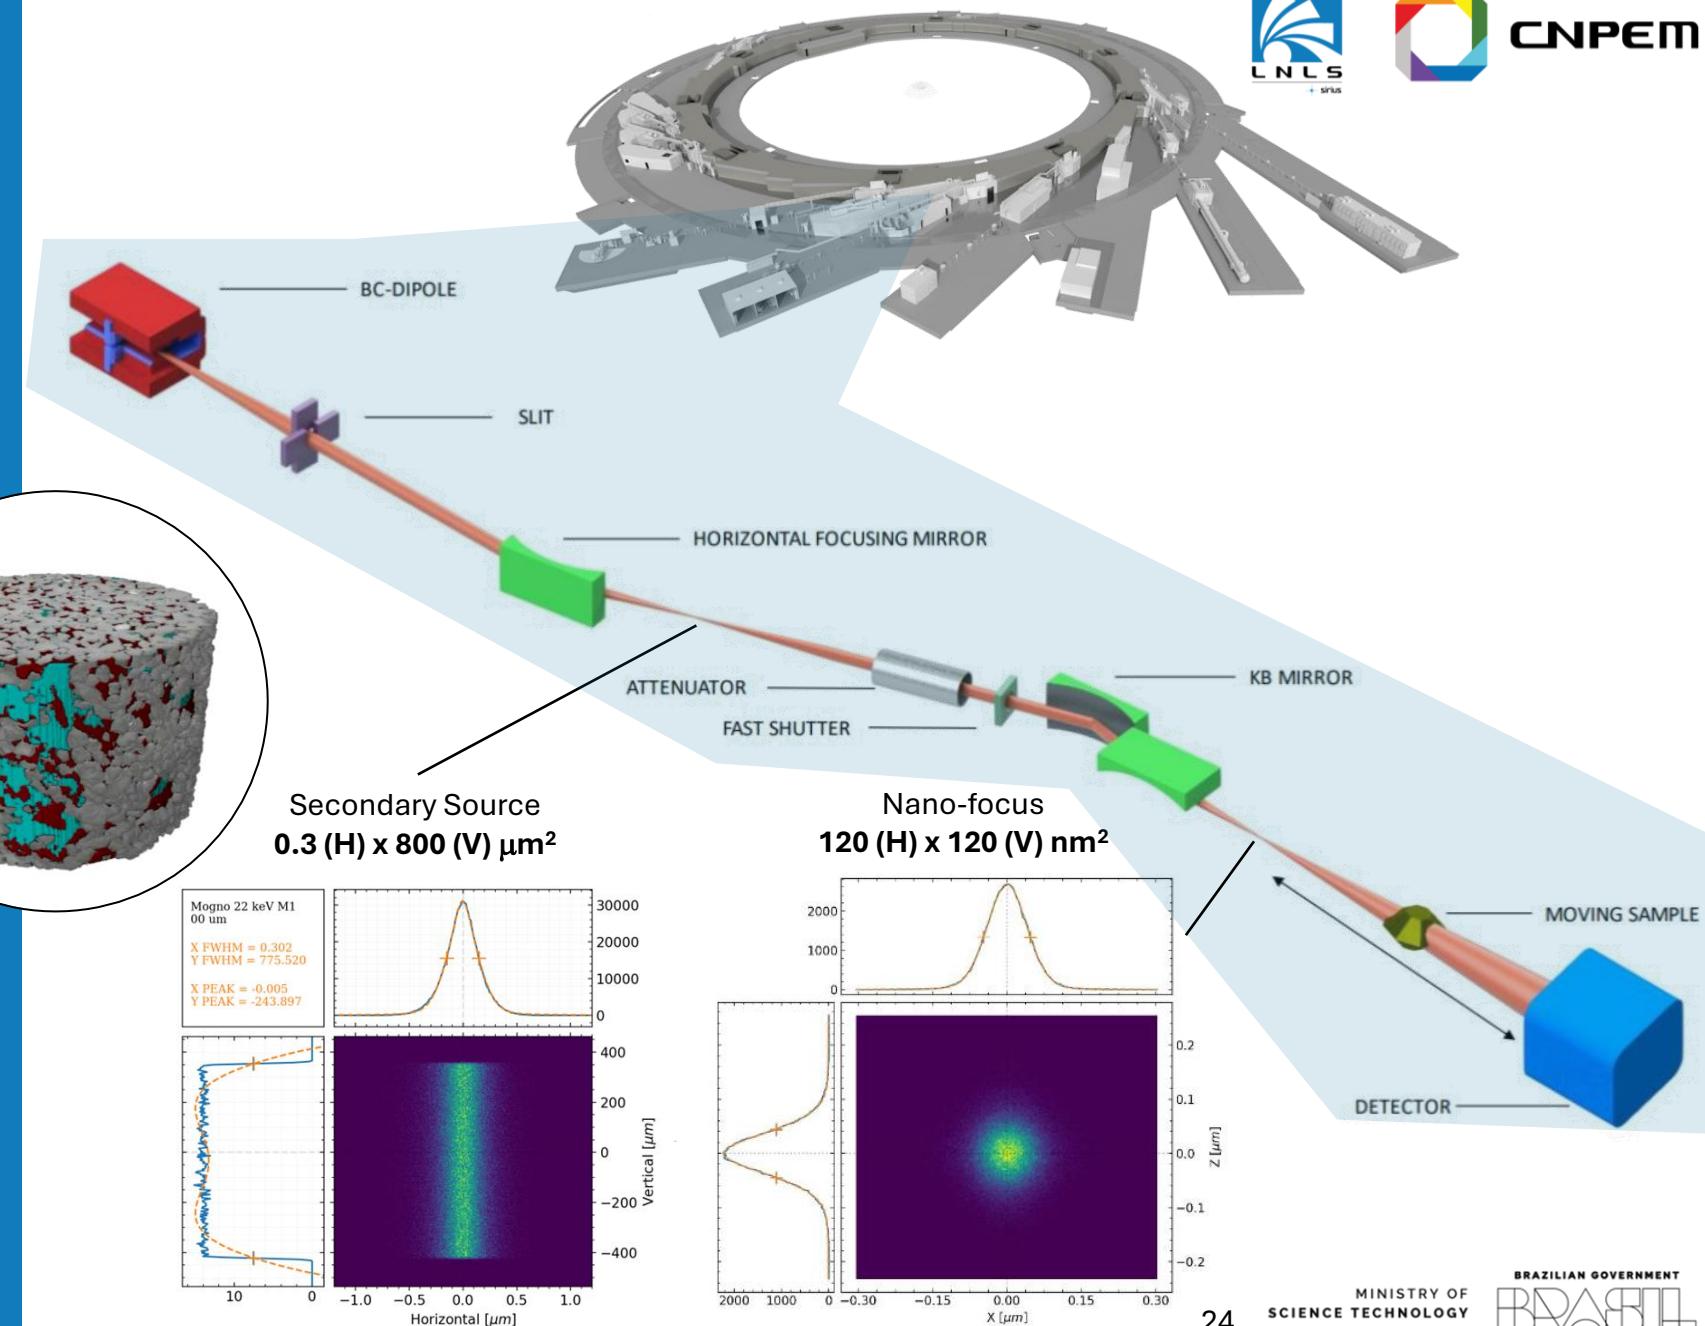

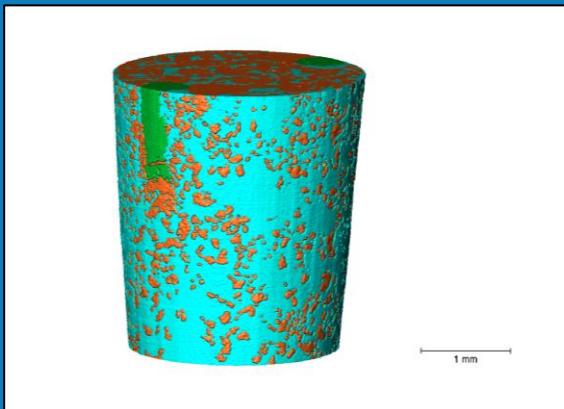

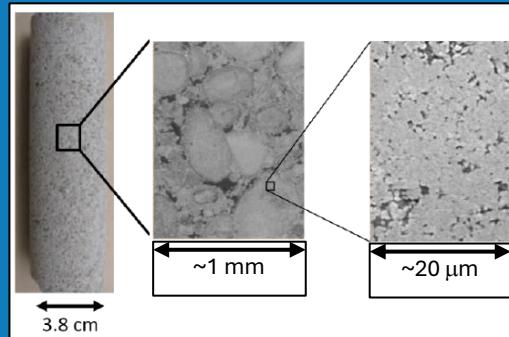

## Thermal drift measurement in perovskite sample: 1μm in 7.5h

# MOGNO beamline

## Micro and Nano tomography

- Zoom from 50 to 0.1  $\mu\text{m}$  resolution
- In-situ experiments with rocks in pre-salt reservoir conditions
- Various tomography experiments

# Why Systems Engineering for Synchrotrons?

- **Beamlines are Complex Systems:**
  - Highly connected;
  - Performance is highly sensitive to more than one module;
  - Often present competing requirements (i.e. temporal resolution vs. Spatial resolution vs. Environment conditions);
- **Many different stakeholders often involved**
  - Different languages;
  - Different points of view;
  - Different restrictions and needs;
- **Beamline's life-cycle often includes upgrades to keep up with scientific community demands**
- **Many Beamlines are yet to be built (~25)**
  - Reusability opportunities;
  - Technological heritage opportunities;

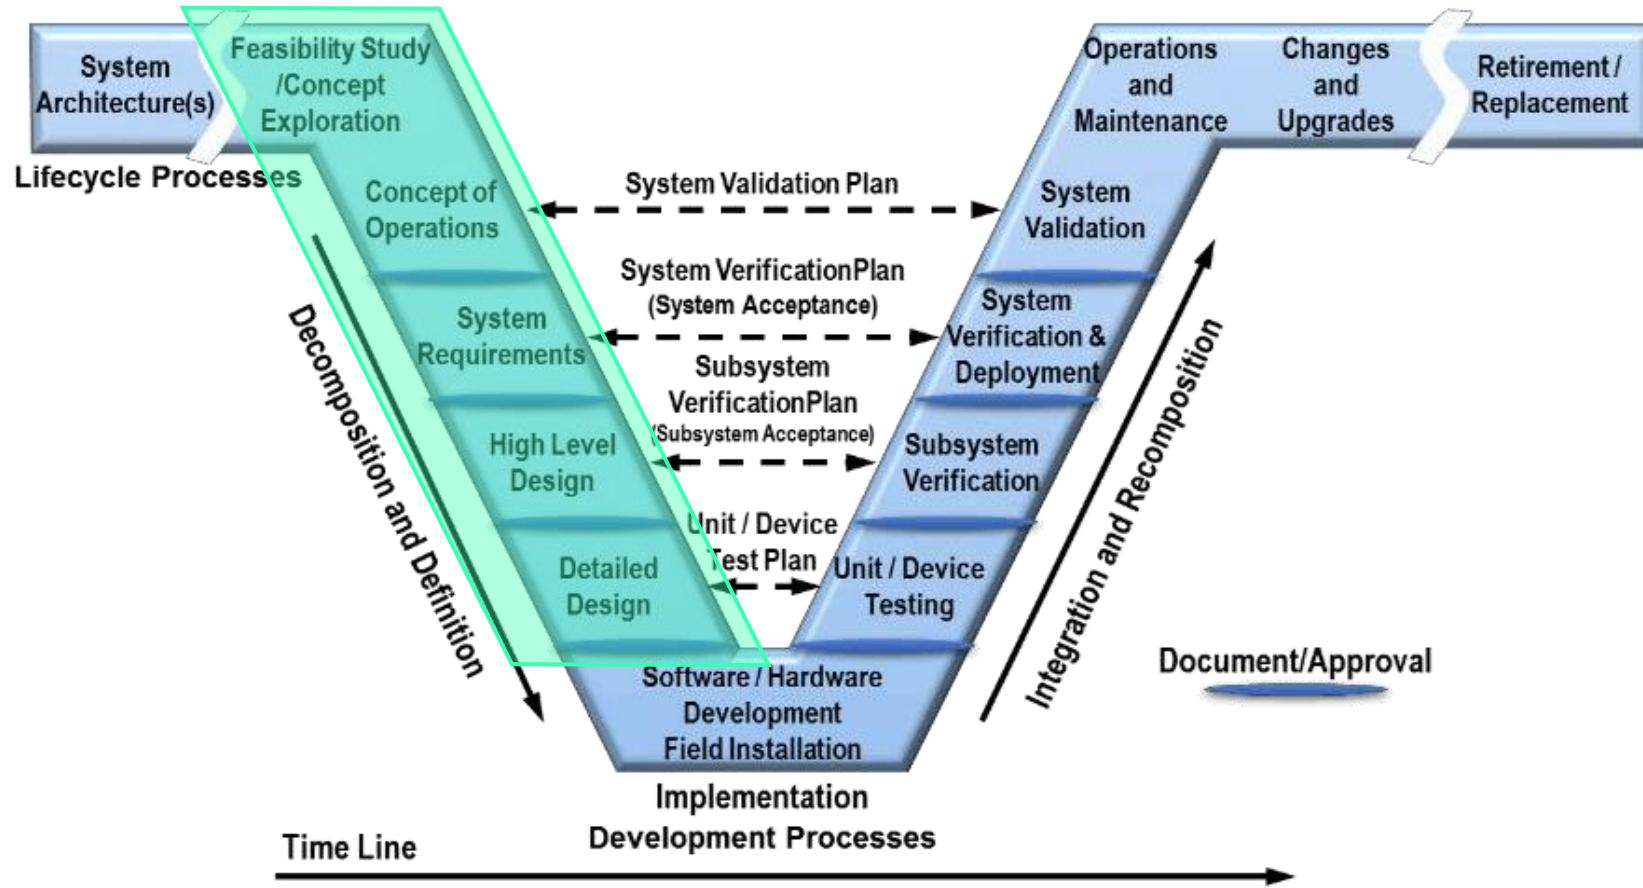

# First steps in SE and MBSE implementation!

- First institutional application of formal SE and MBSE started in 2023
- Better capabilities demands better performance, and pushes for technological advancement
- Many collaborations starting inside and outside Brazil
- Goal: to start showing value in improving future projects with quick-and-easy application of SE and MBSE concepts

# Systems engineering workflow for Sirius

# Motivation

## According to INCOSE

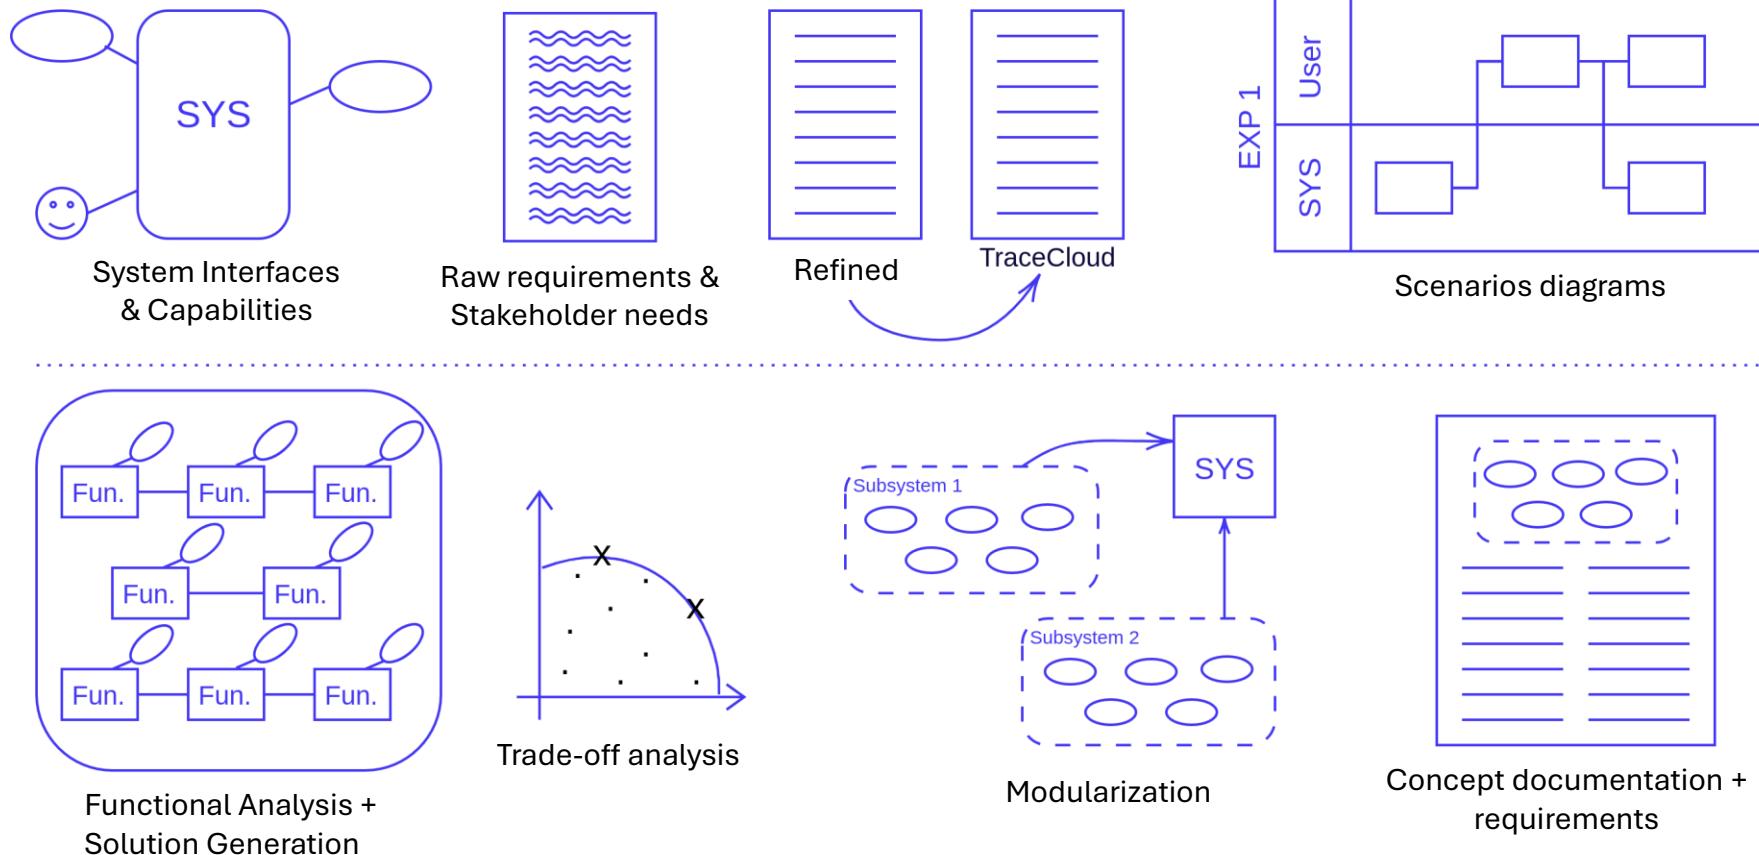

Ref: [www.ppi-int.com](http://www.ppi-int.com)

Systems engineering promotes structured and interdisciplinary collaboration, leading to more efficient project execution and clearer communication across teams.

- Fast Growing
- Experience
- Complexity

# System Engineering Workflow

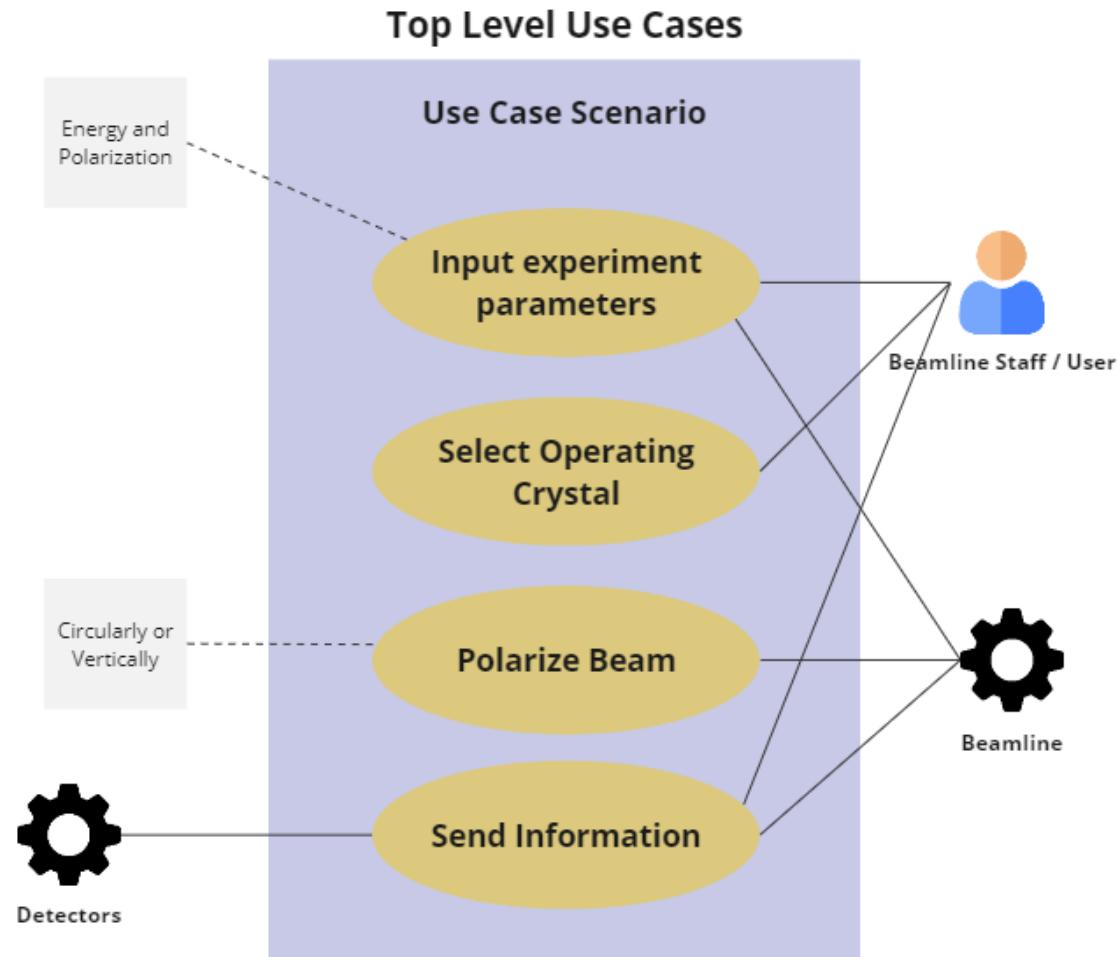

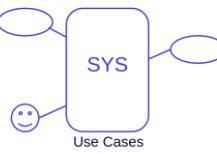

## Overview

We propose an (ideal) Systems Engineering workflow for CNPEM, to gather and manage requirements and architect our systems. The proposal is a fusion of our current design workflow and the traditional one proposed in ES. Each step is described in the following slides.

# System Engineering Workflow

## Problem Domain – System Interfaces & Capabilities

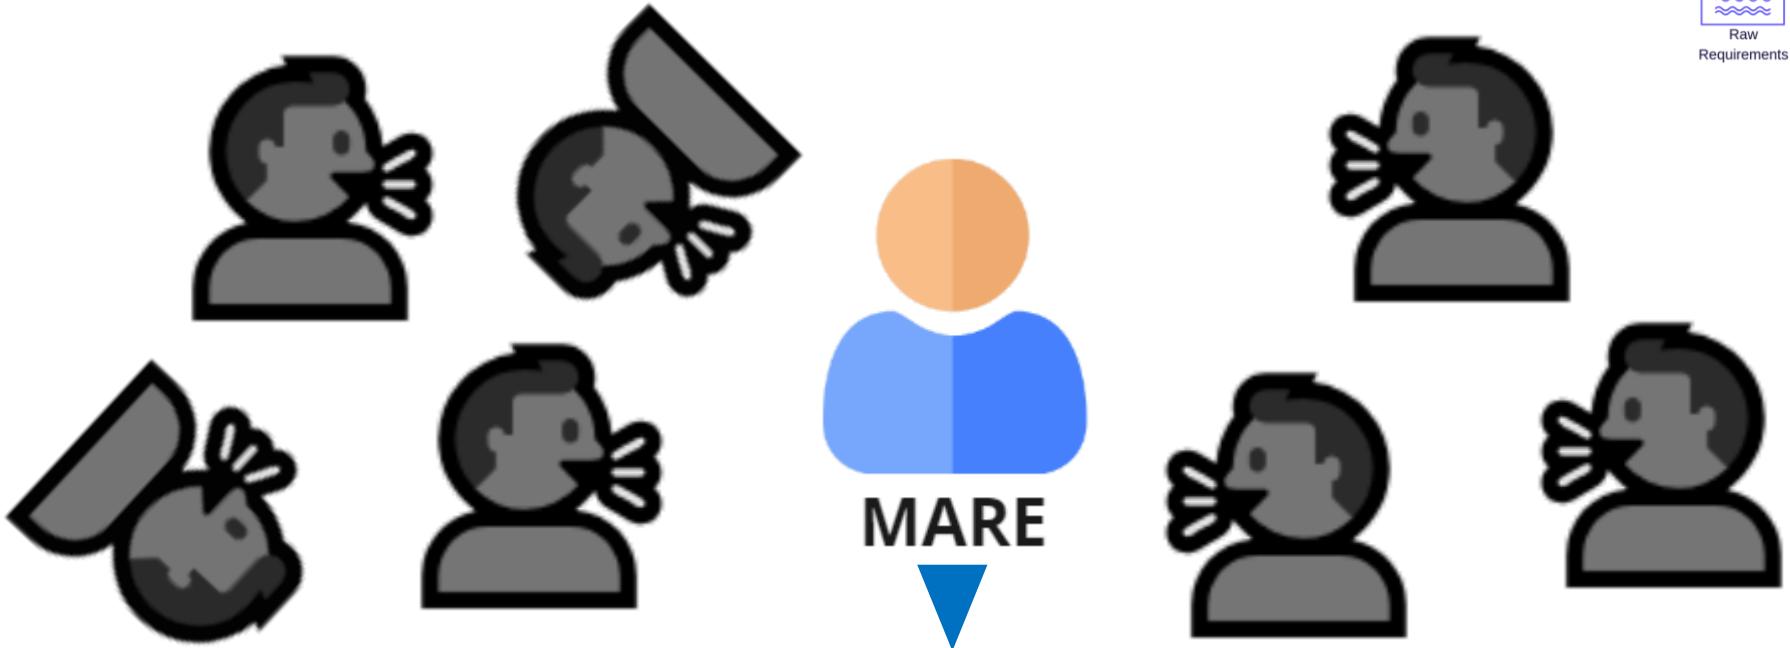

Define Scenarios (how our system interacts with external actors). The definition of interactions between users and systems could be done here to clarify roles and responsibilities. Identify technology gaps to explore

- Stakeholders
- Interfaces
- Benchmark

# System Engineering Workflow

# Problem Domain – Requirements Engineering

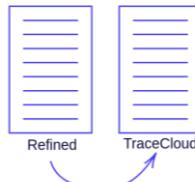

Gather raw requirements from stakeholders and refine them into more descriptive and detailed ones. If needed, break down raw requirements into more than one refined requirement.

- Rewording
  - Rationals

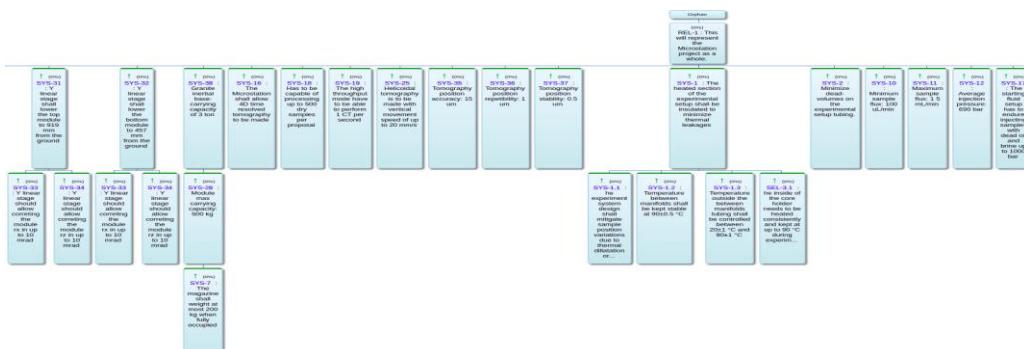

| ID | Description   | Deadline   | Status      | Last Update | Responsibility   | Risk Assessment |              |             | Mitigation Status |                 |        | Overall Project Status |            |        |
|----|---|------------|-------------|-------------|------------------|-----------------|--------------|-------------|-------------------|-----------------|--------|------------------------|------------|--------|
|    |   |            |             |             |                  | Severity        | Type         | Probability | Mitigation        | Associated Risk | Impact | Overall Status         | Completion | Health |
| 1  | Method to detect MRI imaging of small-diseased organs, tissues, and pathologies. Healthy or contaminated by biological agents with accuracy level up to 95% | 2023-09-30 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 2           | No                | No              | Yes    | Yes                    | Yes        | Yes    |
| 2  | Method to detect MRI imaging of ultrasmall nuclei and atomic particles. Healthy or contaminated by biological agents with accuracy level up to 98%          | 2023-10-15 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 3           | No                | No              | No     | Yes                    | Yes        | Yes    |
| 3  | Method to detect MRI imaging of different cell types in complex of tissue   | 2023-11-01 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 1           | No                | Yes             | Yes    | Yes                    | Yes        | Yes    |
| 4  | Method to detect MRI imaging of biological agents in the brain region   | 2023-12-01 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 2           | No                | Yes             | Yes    | Yes                    | Yes        | Yes    |
| 5  | Microscopy in the cryogenic temperature of 170K   | 2024-01-15 | In Progress | 2023-09-01  | Dr. Jane Project | Medium          | Decommission | 3           | No                | No              | Yes    | Yes                    | Yes        | Yes    |
| 6  | Microscopy in the sample below 200K to 250K   | 2024-02-15 | In Progress | 2023-09-01  | Dr. Jane Project | Medium          | Decommission | 2           | No                | No              | Yes    | Yes                    | Yes        | Yes    |
| 7  | Provide a beam with high-photon flux  | 2023-09-30 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 3           | No                | No              | Yes    | Yes                    | Yes        | Yes    |
| 8  | Nano-micrography with spherical wavefront   | 2023-10-15 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 2           | No                | Yes             | Yes    | Yes                    | Yes        | Yes    |
| 9  | Nano-micrography with plane wavefront   | 2023-11-01 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 2           | No                | Yes             | Yes    | Yes                    | Yes        | Yes    |
| 10 | Provide a core-based geometry   | 2023-11-15 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 3           | No                | Yes             | Yes    | Yes                    | Yes        | Yes    |
| 11 | Provide an adjustable field of view   | 2023-12-01 | Approved    | 2023-08-15  | Dr. Jane Project | Medium          | Decommission | 2           | No                | Yes             | Yes    | Yes                    | Yes        | Yes    |

# System Engineering Workflow

## Problem Domain – Requirements Engineering

|     |  |  |
|-----|--|--|
| 5.1 | The scenario shall perform the counting of different cell types in samples of tissues and organs.  | Identify cell types and their response to the infection.   |
| 5.2 | The scenario shall identify a minimum phase contrast of <b>100x</b> .  | Identify the effect of the infection on the samples (or on specific portions of the samples) in terms of size and structure.                                     |
| 5.3 | The scenario shall be capable of distinguishing between healthy and contaminated samples.  | Identify the effect of the infection on the samples (or on specific portions of the samples) through a statistical analysis.                                     |
| 5.4 | The scenario shall allow counting the number of cell nuclei in the sample.   | Identify the effect of the infection on the samples (or on specific portions of the samples) in terms of size and structure.                                     |
| 5.5 | The scenario shall identify the cellular morphology of the tissue or organ sample.   | Identify the effect of the infection on the samples (or on specific portions of the samples) in terms of size and structure.                                     |
| 5.6 | The scenario shall identify the nuclear morphology of the cells in the tissues or organs samples.  | Identify the effect of the infection on the samples (or on specific portions of the samples) in terms of size and structure.                                     |
| 5.7 | The scenario shall be capable of calculating the cellular area or volume of tissues and organs samples, for histological or 3D images, respectively. | Identify the effect of the infection on the samples (or on specific portions of the samples) in terms of size and structure, and through a statistical analysis. |
| 5.8 | The scenario shall be capable of calculating the cellular area or volume of tissues and organs samples, for histological or 3D images.               | Identify the effect of the infection on the samples (or on specific portions of the samples) in terms of size and structure, and through a statistical analysis. |

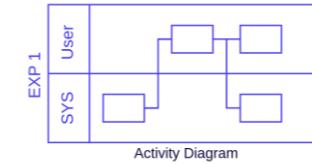

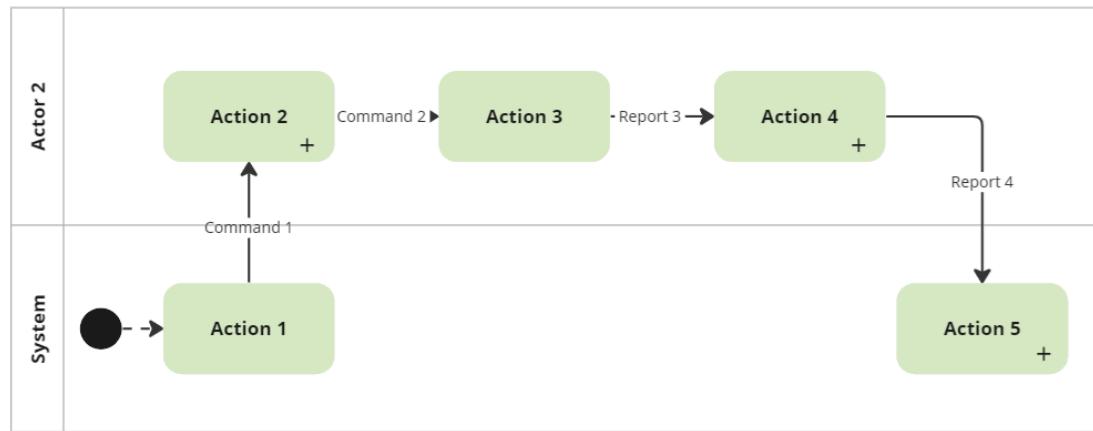

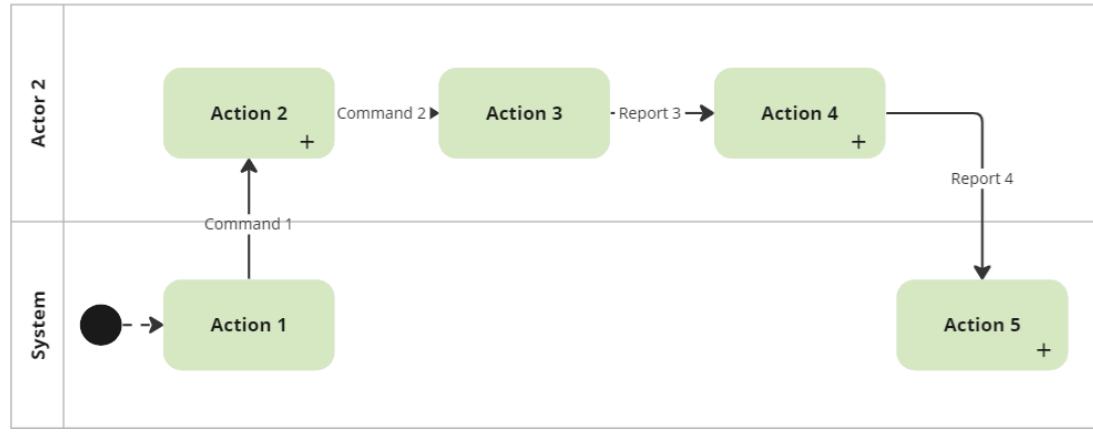

Gather raw requirements from stakeholders and refine them into more descriptive and detailed ones. If needed, break down raw requirements into more than one refined requirement.

- Functional vs Non-functional
- Traceability
- ReqIF

# System Engineering Workflow

## Problem Domain – Experiment Structure

Function A

Function B

Function C

⋮

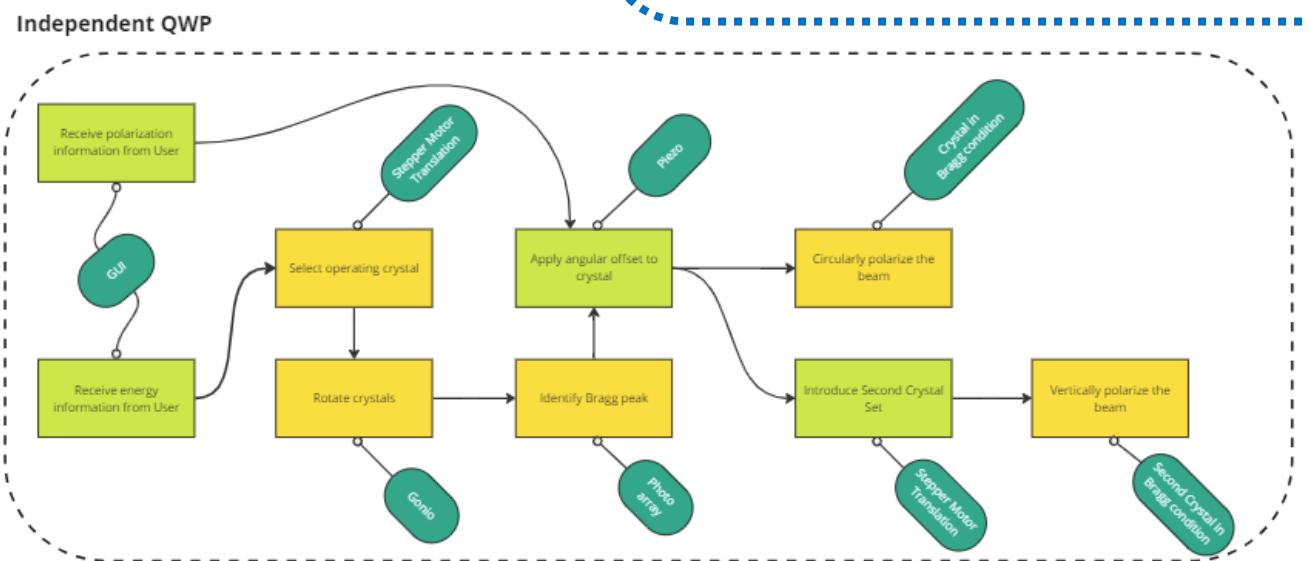

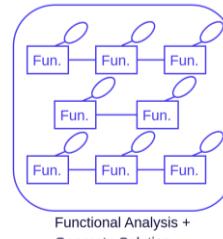

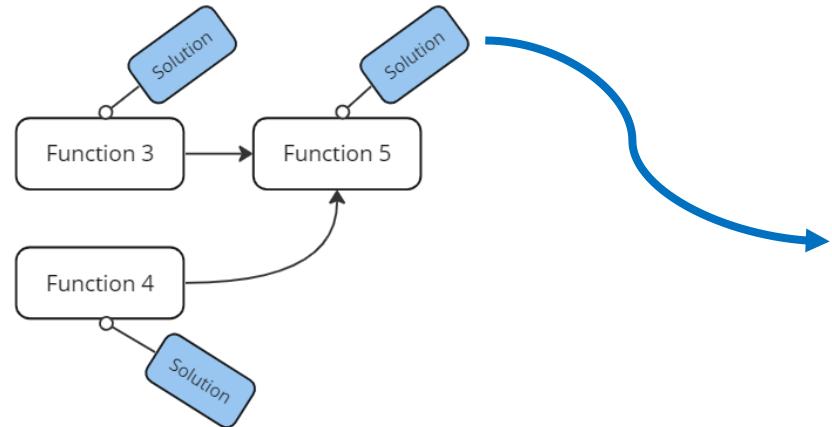

Function N

Map the possible uses of the system, experiments, safety procedures, and maintenance. In-depth understanding of what the system should accomplish. Try to keep the problem solution neutral and identify the critical steps and interfaces in the expected workflow.

- Mission and capabilities
- Actors and Entities
- Abstractions

# System Engineering Workflow

## Solution Domain – Solution Proposal

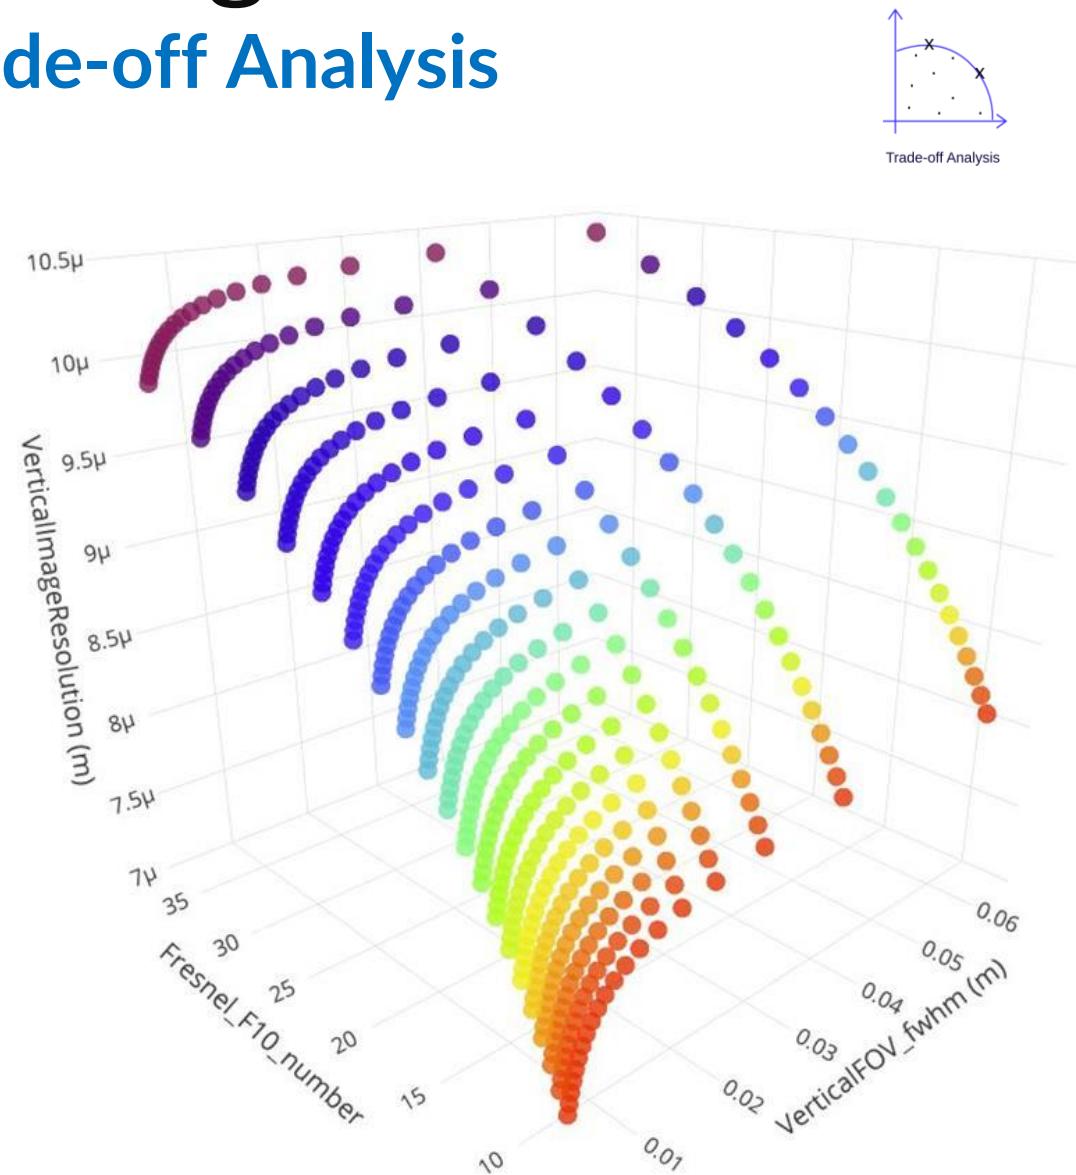

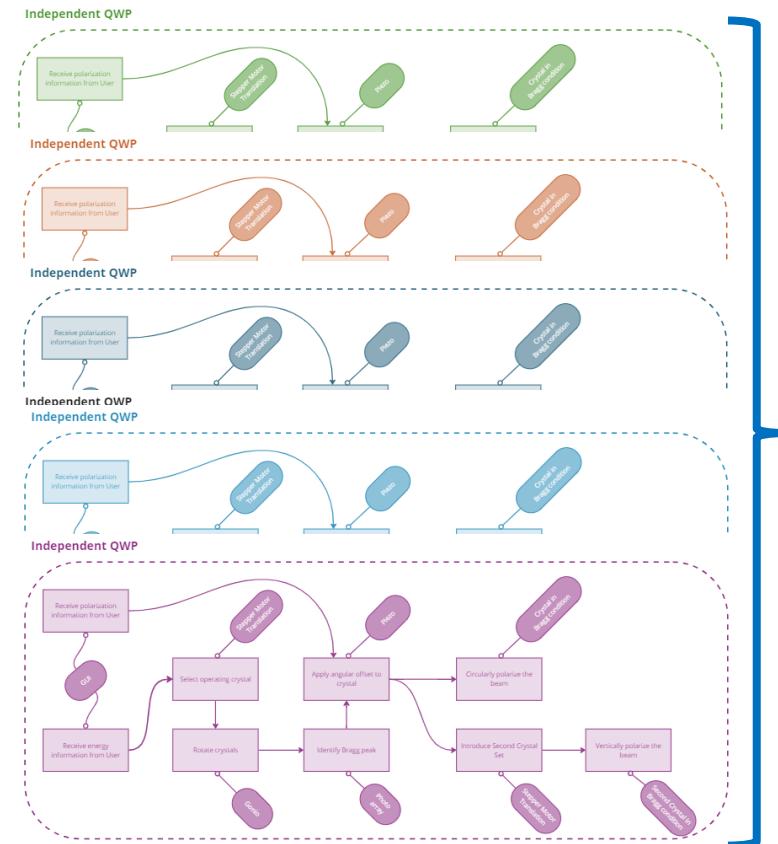

Identify solutions for system functions. Propose different solutions set to explore interfaces between components. Define possible spin-offs of subsystems for internal P&D.

- Creativity
- Risk Management
- Experience

# System Engineering Workflow

## Solution Domain – Trade-off Analysis

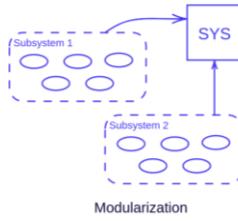

Confront different solutions for the expected functions and different sets of solutions to compose the system. Model the solutions to perform a trade-off analysis.

- Performance
- Cost
- Schedule
- Low-fidelity models

# System Engineering Workflow

## Solution Domain – Modularization

Identify Subsystems and their related requirements and functions. Minimize interfaces between subsystems. Aggregate similar functions and consider LNLS organizational structure and workgroups.

- DSM
- Interfaces
- LNLS teams

# System Engineering Workflow

## Solution Domain – Sub-system Consolidation

Create documentation and models from requirements, subsystems, and physical modules and share them with other teams (DEL and/or MArE).

- Model x Document
- Interfaces
- Solution Concept

# Systems engineering software workflow

# System Engineering Workflow

## Solution Domain - Model Federation Integration

- Raw requirements compilation
- 1st rewording
- Understanding of rationales

# Requirements Management

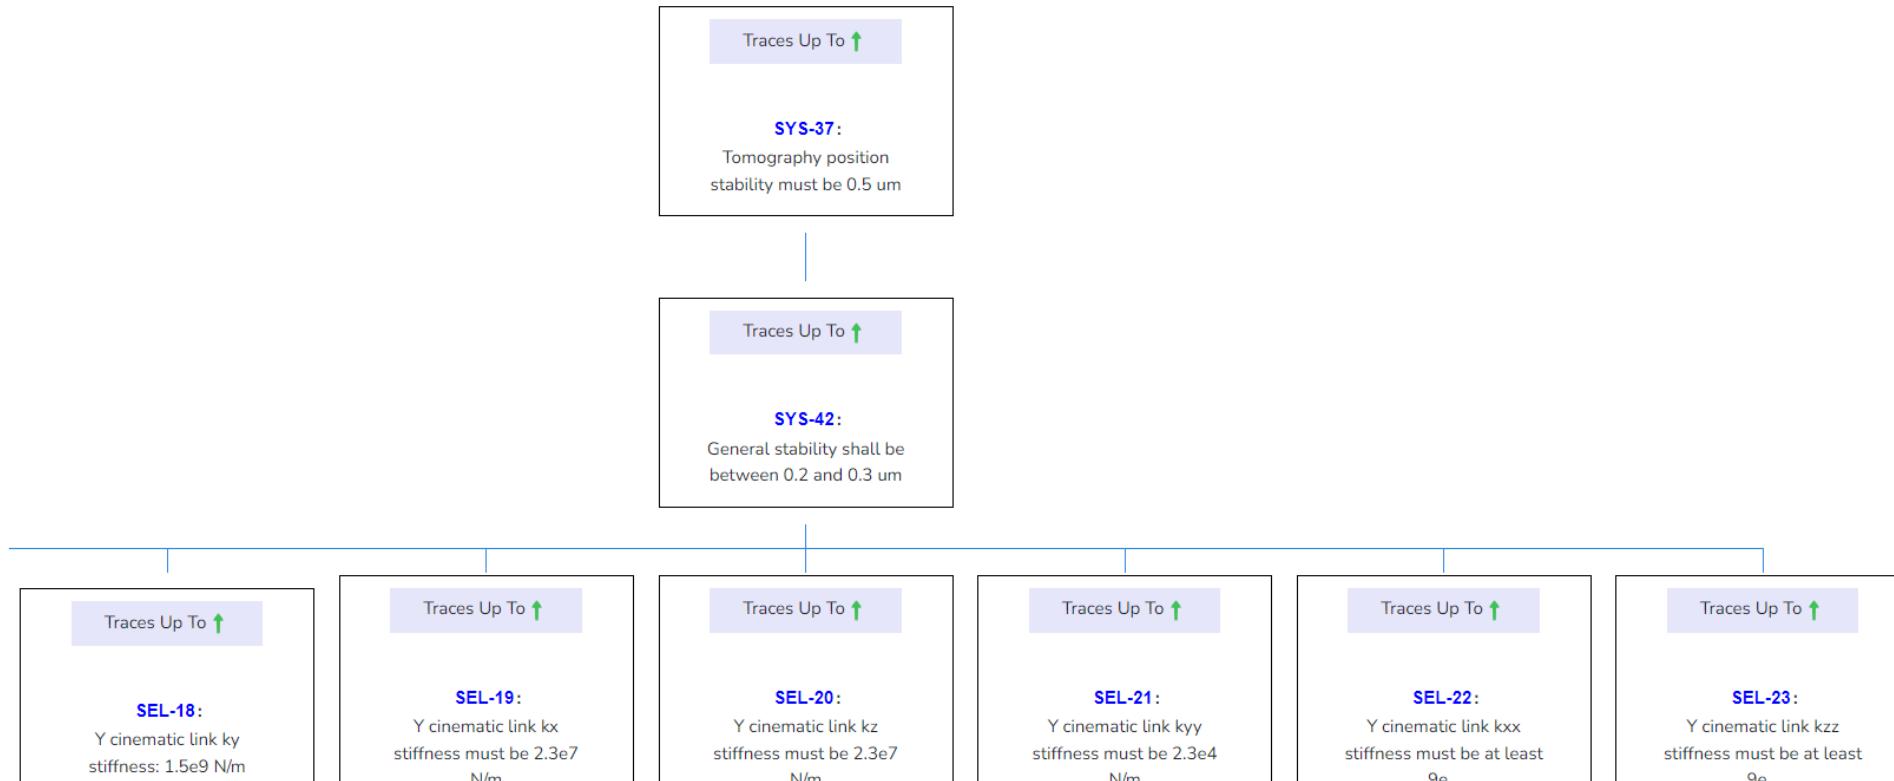

Organize what we need the system to deliver

Examples of the Mogno Microstation project

# Requirements Management

Organize what we need the system to deliver

**tracecloud** Global → **ReqIF**  
Requirements Interchange Format

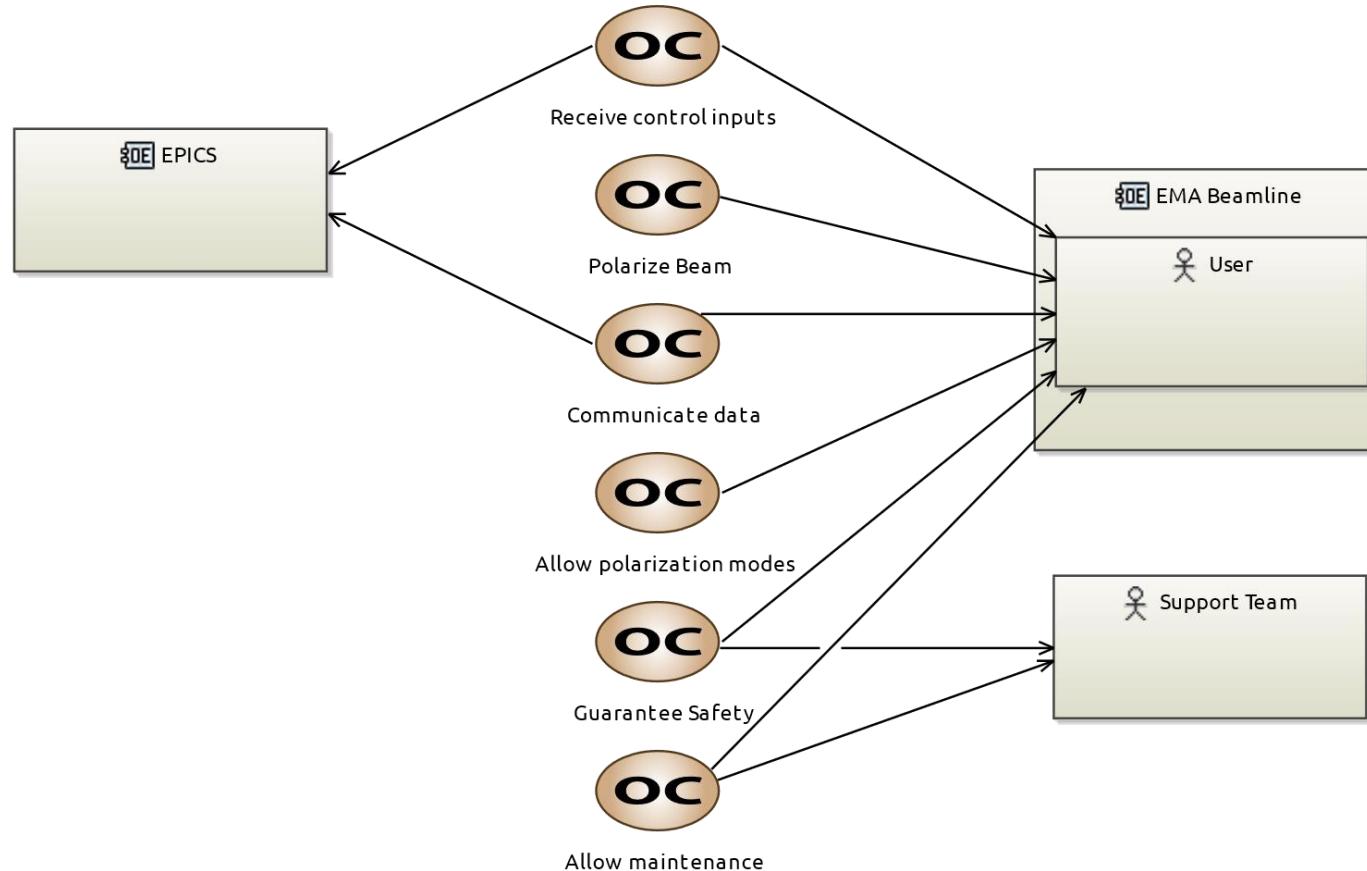

Visualization of dependencies between requirements

- Notion of the impacts of changes
- Understanding "bottleneck" parameters

# Capella

# Capella and Systems Architecture

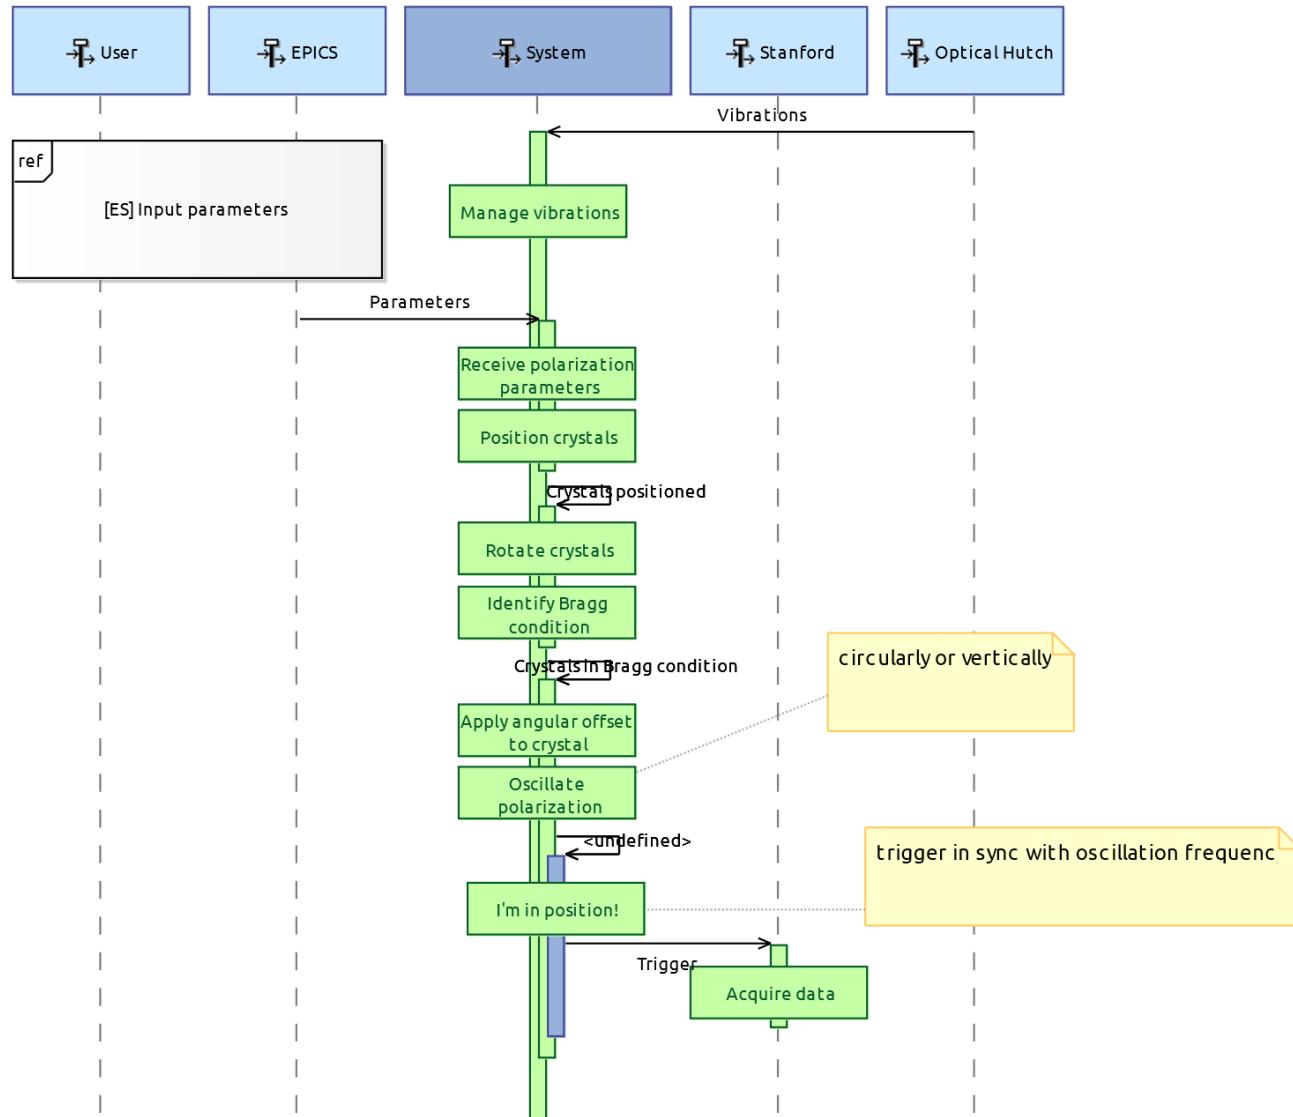

## Operational Capabilities

Description of operational capabilities for identifying interfaces between the system's capabilities and the main external agents that will use it.

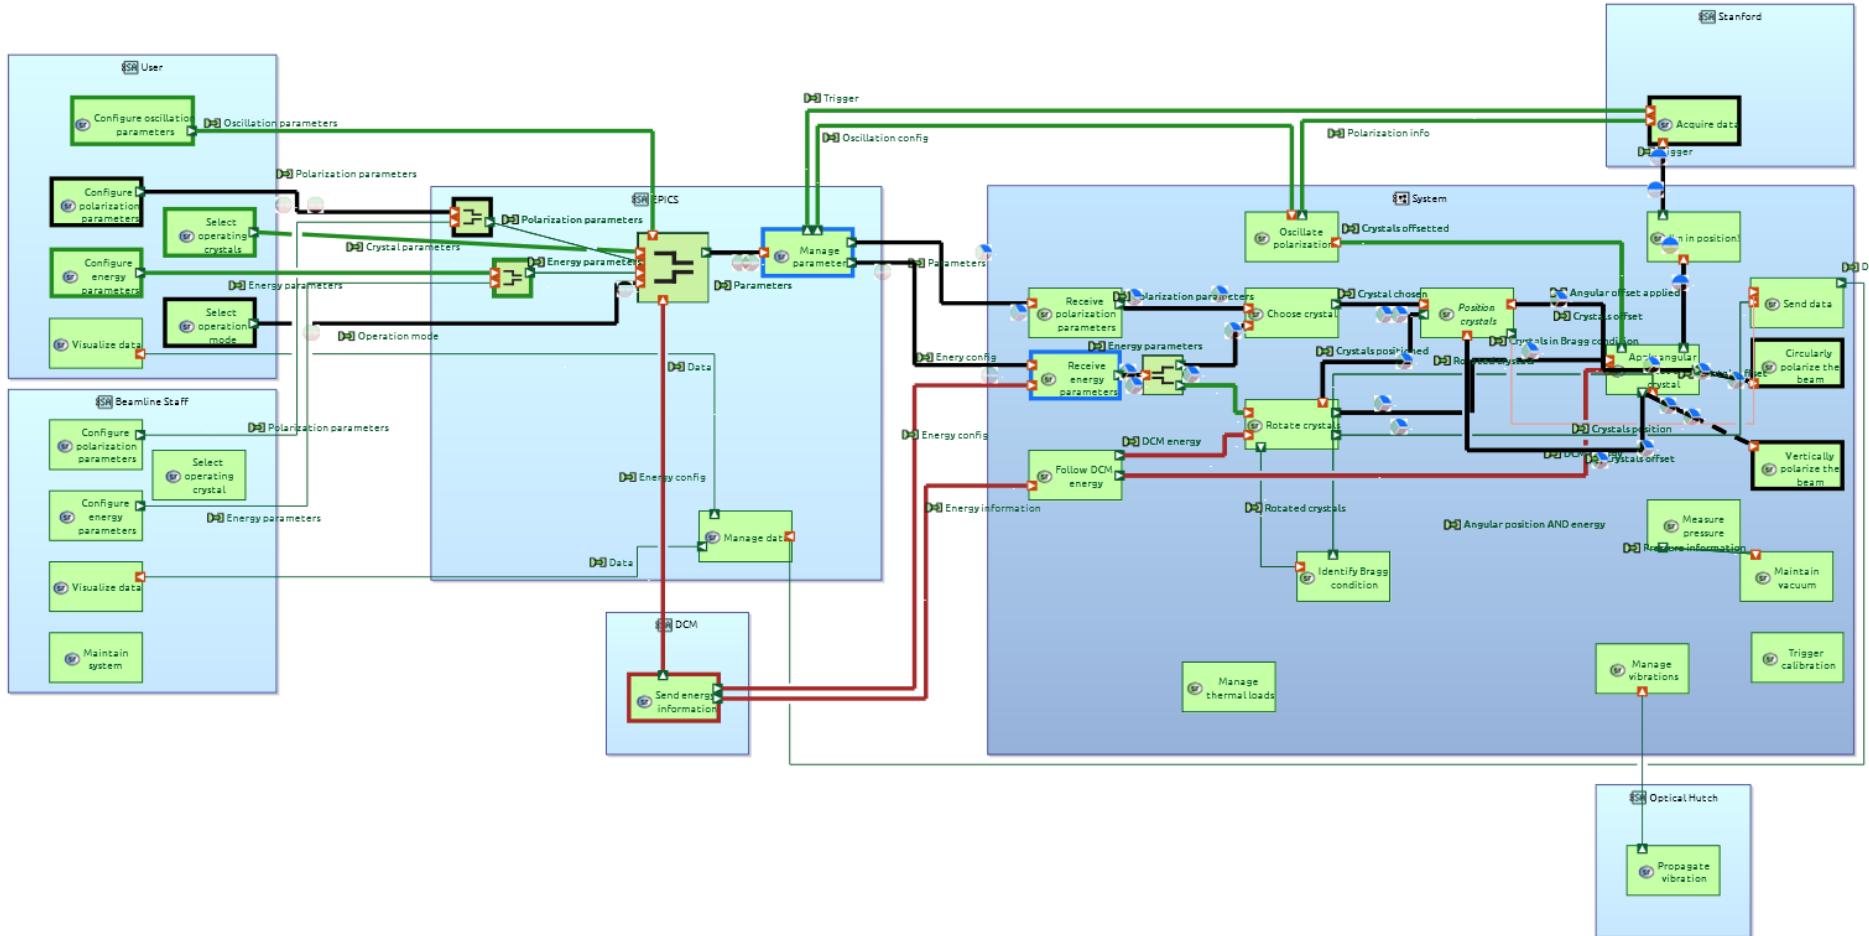

# Capella and Systems Architecture

## Scenarios

# Capella and Systems Architecture

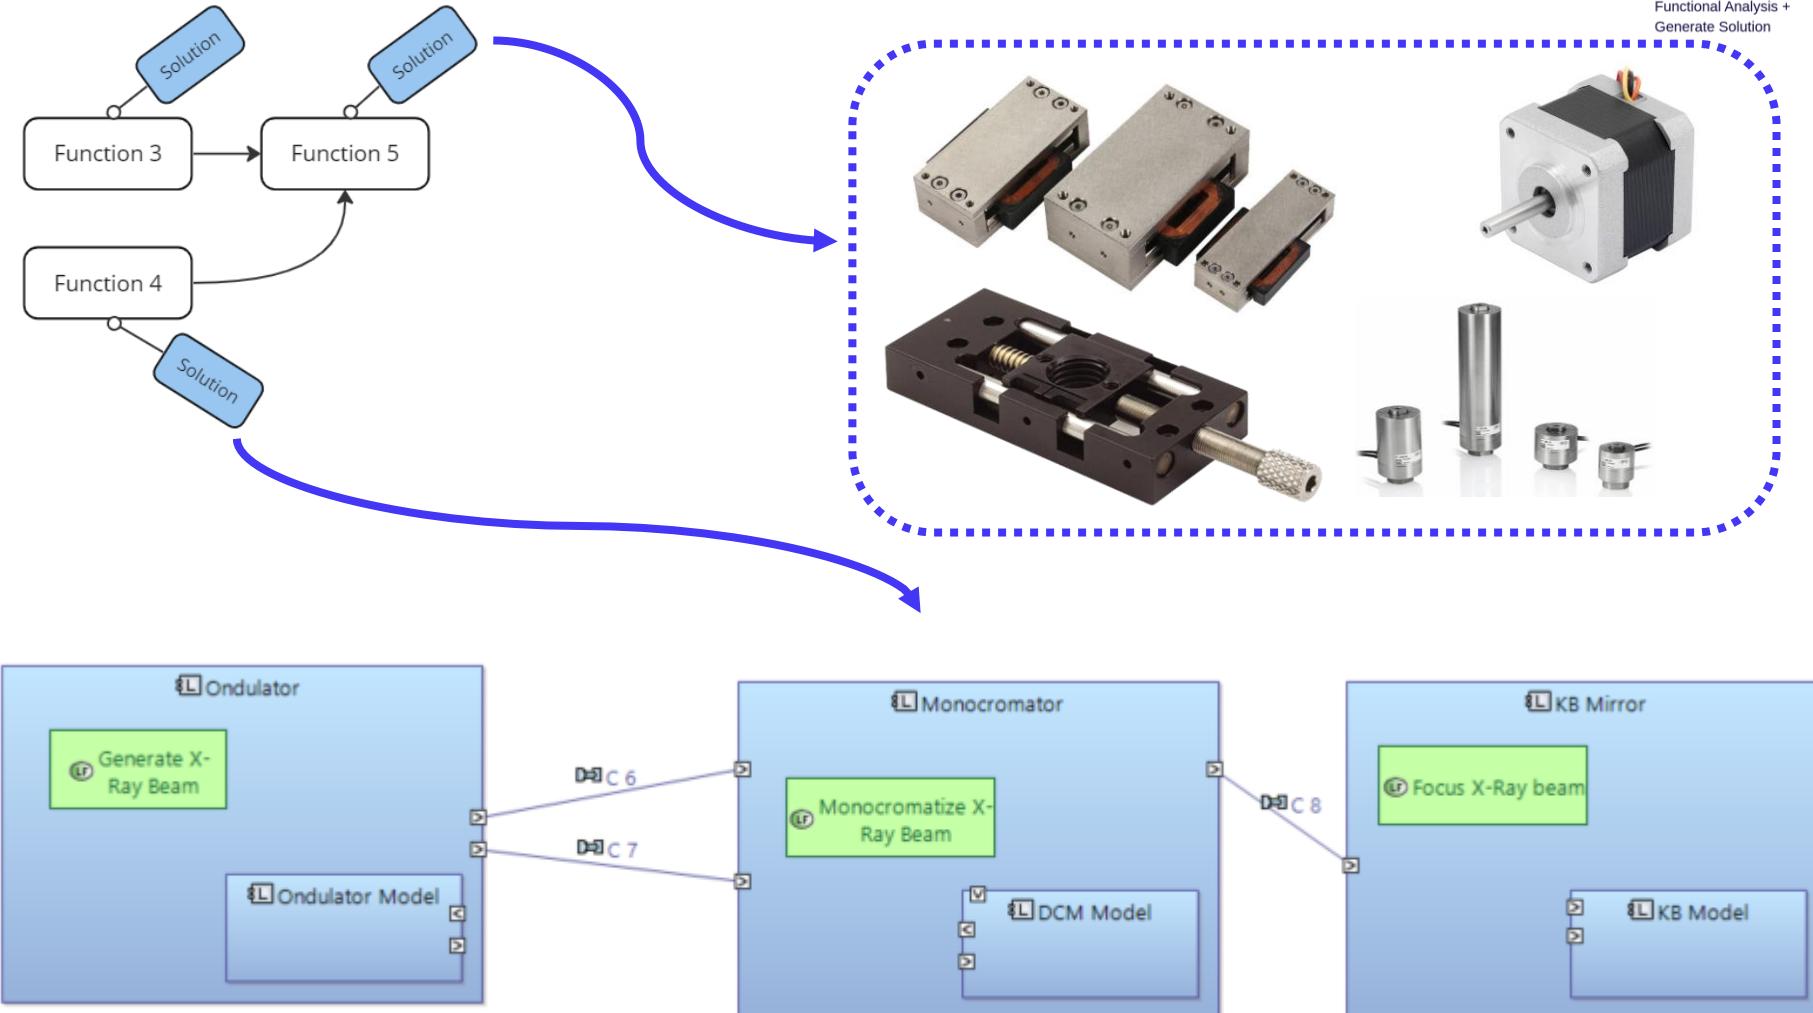

## Function Architecture and Functional Chains

Specification of the functions of the system in question and the external actors with which it interacts.  
Definition of information exchanges.  
Exchange of information, energy and mass.

# System Engineering Workflow

## Solution Domain – Solution Proposal

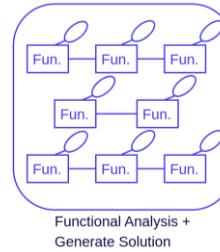

Identify solutions for system functions. Propose different solutions to explore interfaces between components. Define possible spin-offs of subsystems for internal R&D. Model integrated solutions.

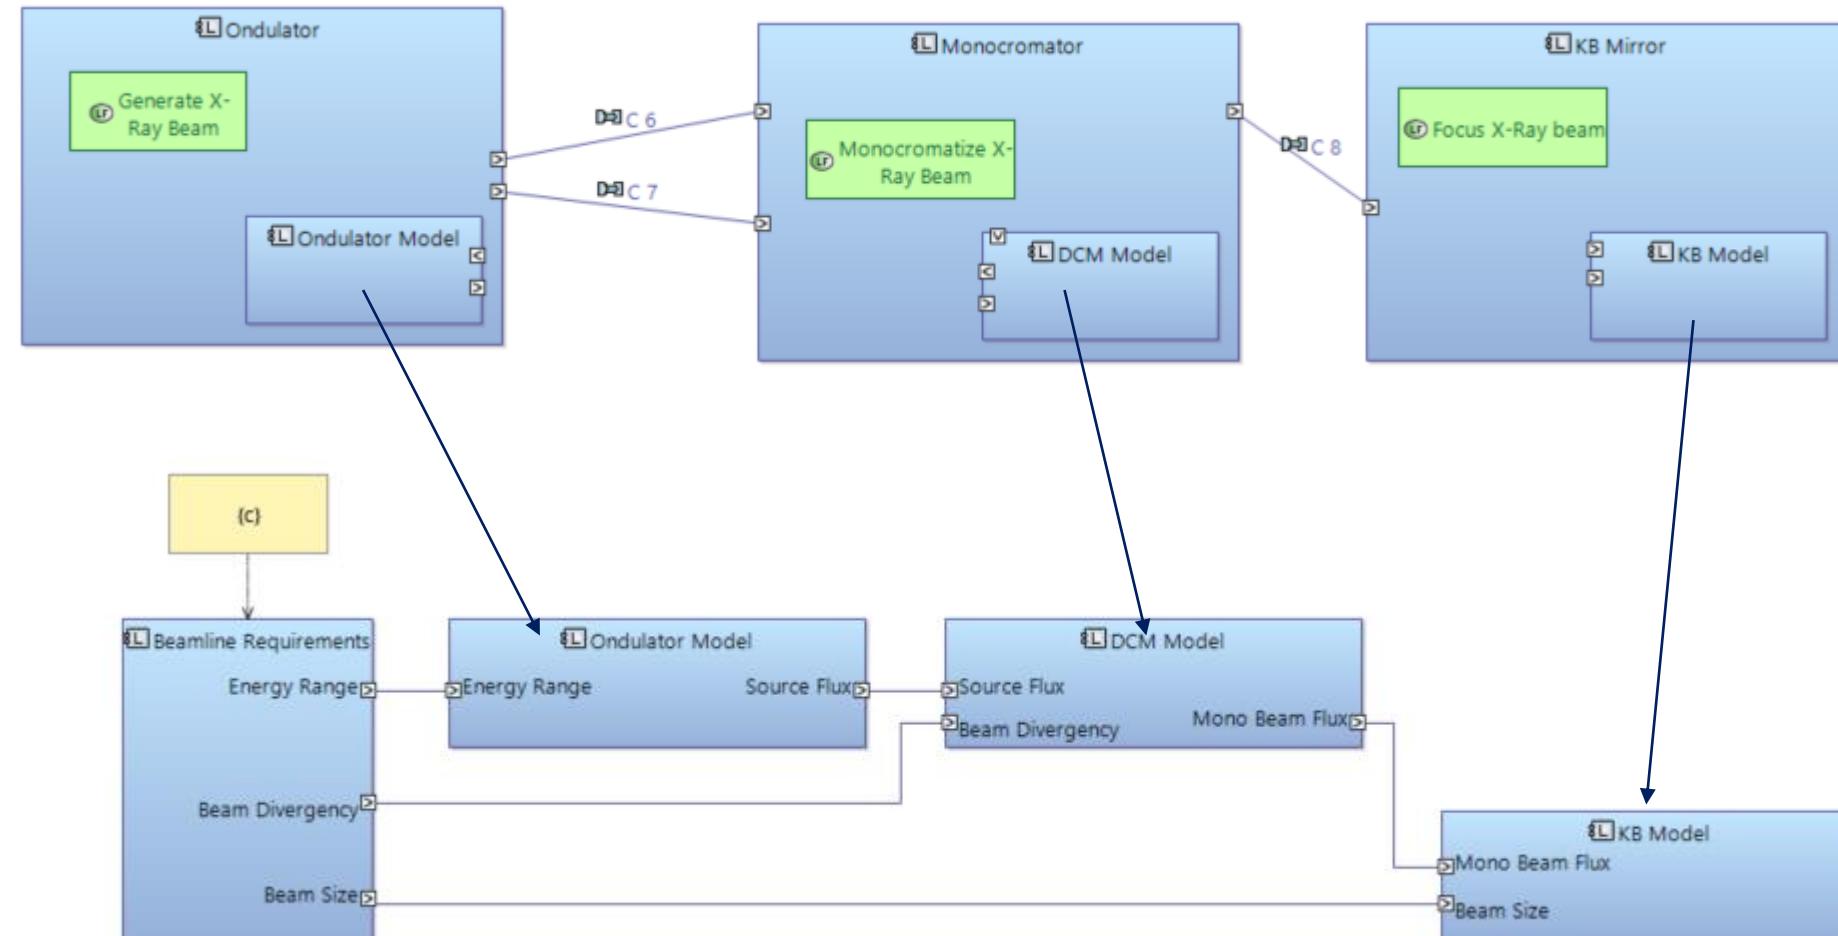

- Creativity
- Risk Management
- Experience

# System Engineering Workflow

## Solution Domain – Solution Modeling

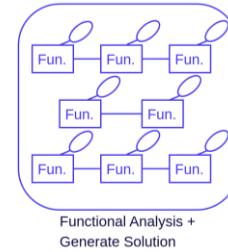

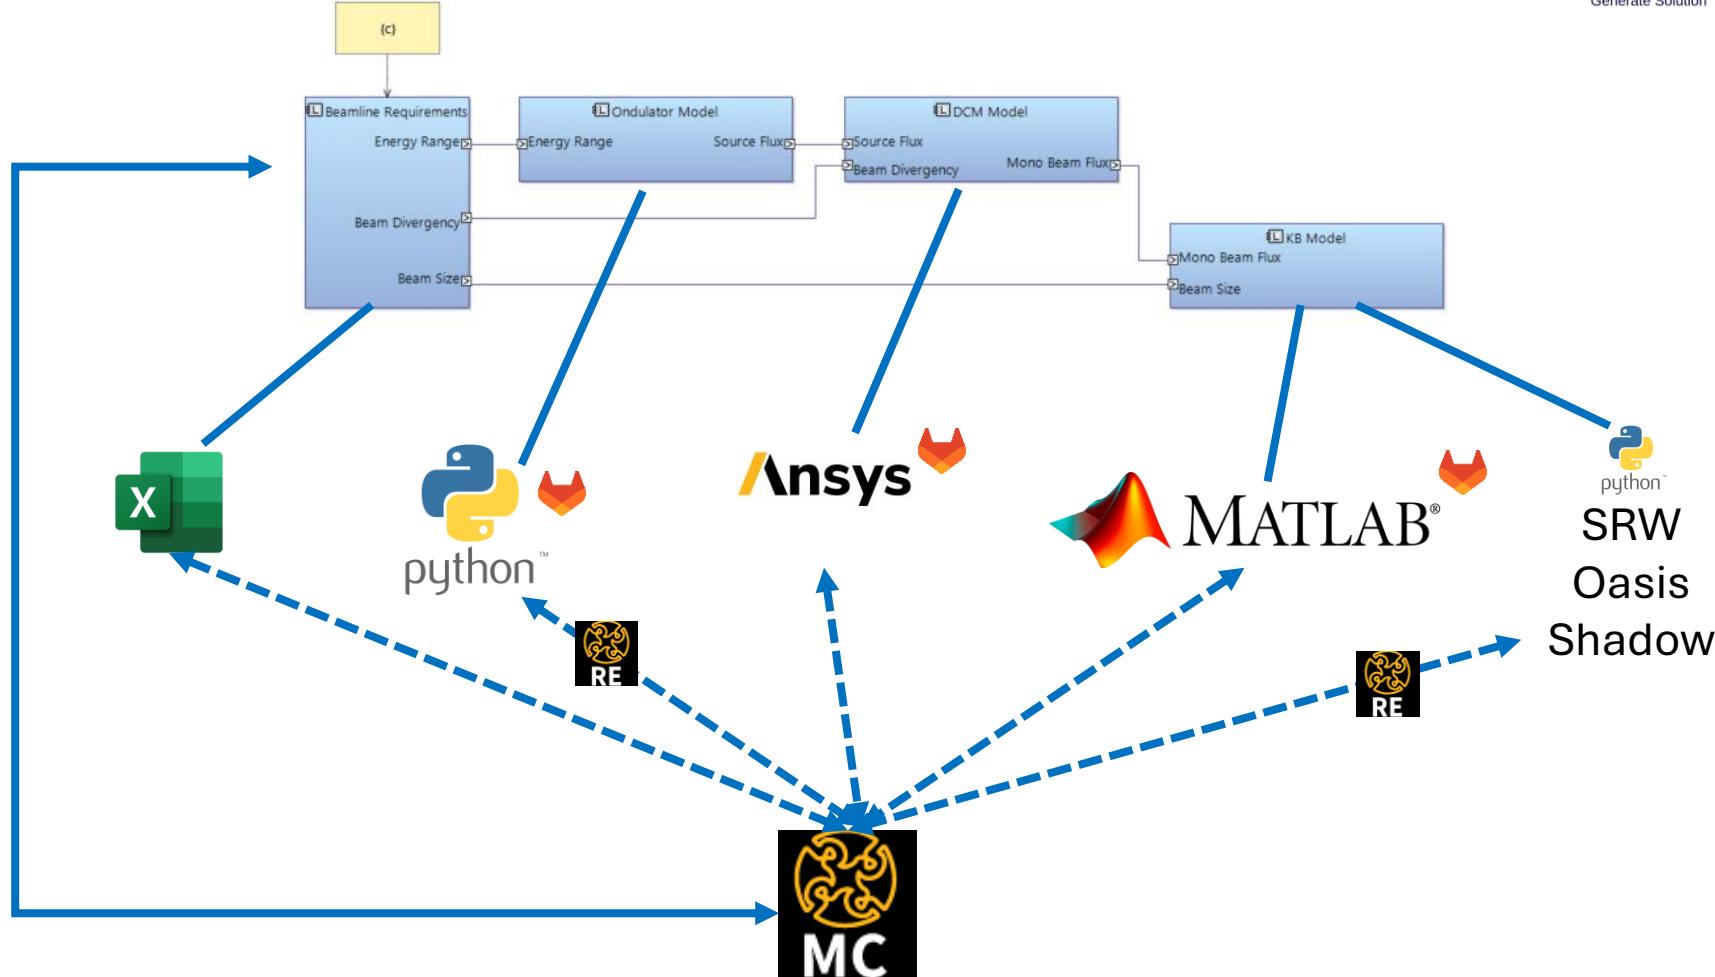

Functional Analysis +  
Generate Solution

Identify solutions for functions.  
Propose different interfaces between components.  
Define possible spin-offs of subsystems for internal R&D.  
Model integrated solutions.

# System Engineering Workflow

## Solution Domain - Model Federation Scheme

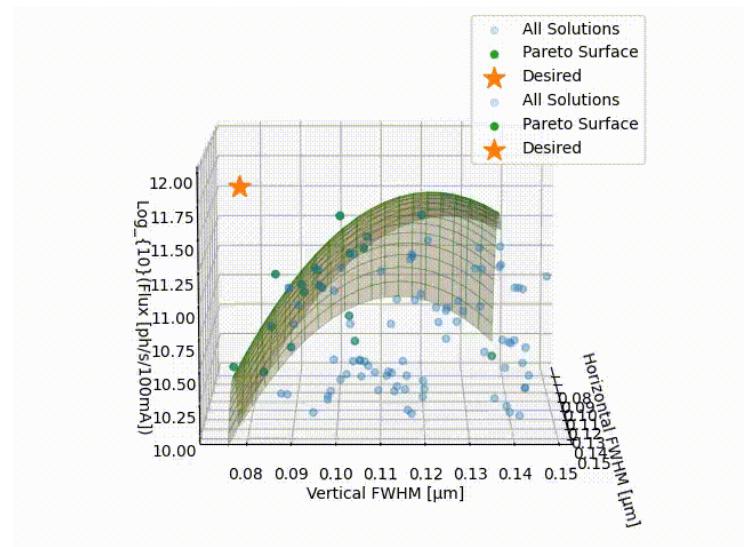

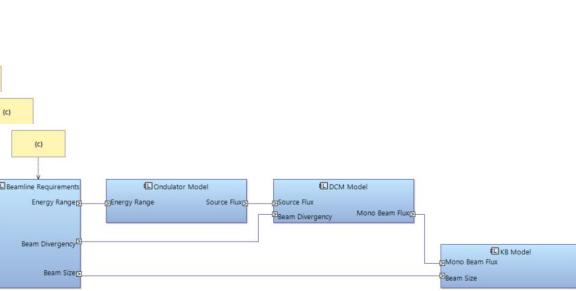

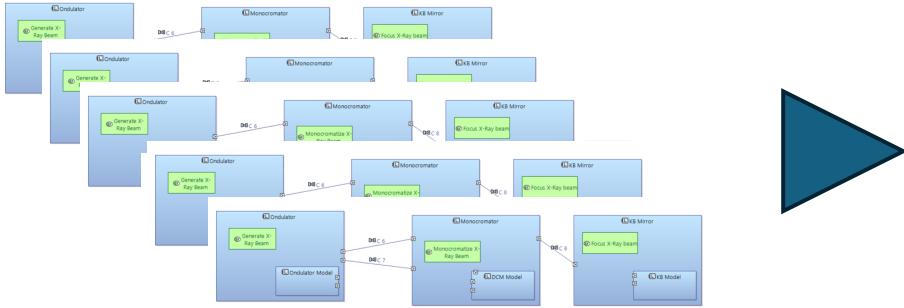

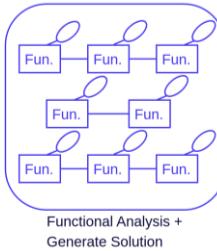

Functional Analysis +  
Generate Solution

Trigger code by Capella and save the results to a common file (.yaml). Capella can access this file using python4Capella and allocate parameter in the model (good for automatic reporting). In addition, Capella can trigger optimizations in model federation through ModelCenter

# System Engineering Workflow

## Solution Domain – Solution Trade-off

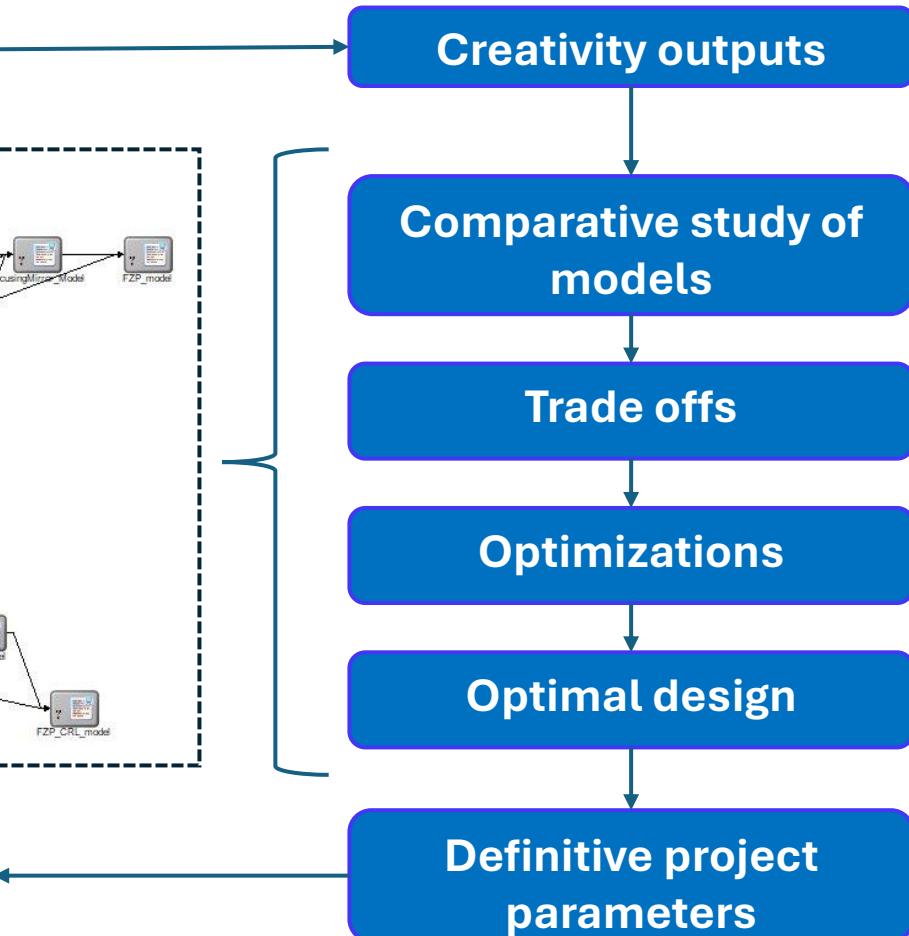

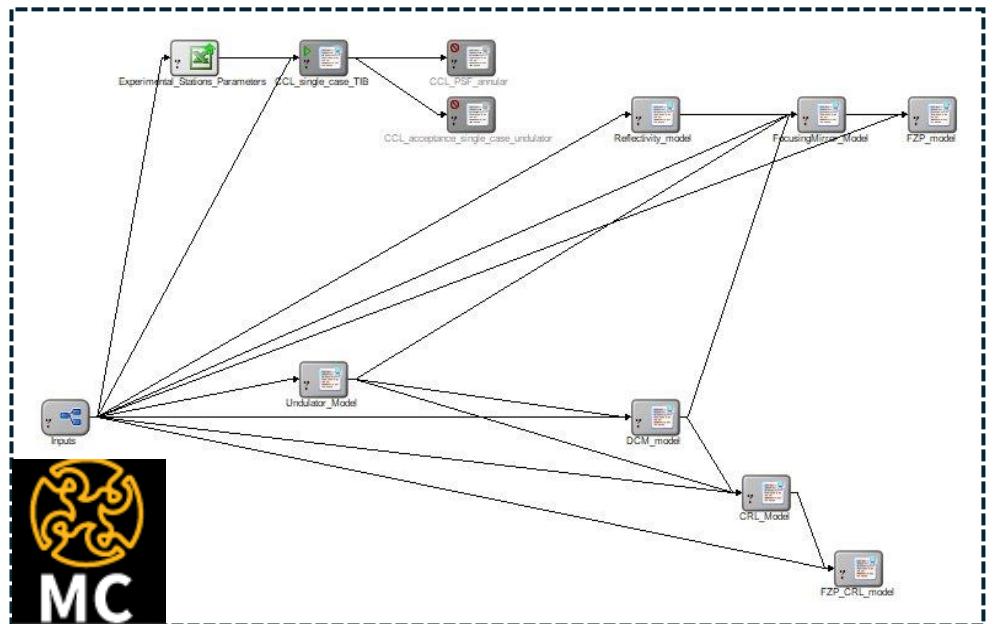

Identify solutions for functions.  
Propose different solutions to explore interfaces between components.  
Define possible spin-offs of subsystems for internal R&D. Model integrated solutions.

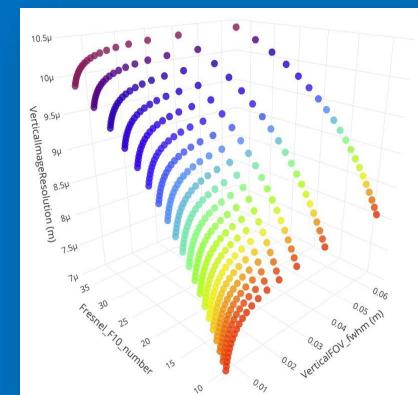

# ANSYS Model Center

# ANSYS Model Center

## ORION Models and Capella integration

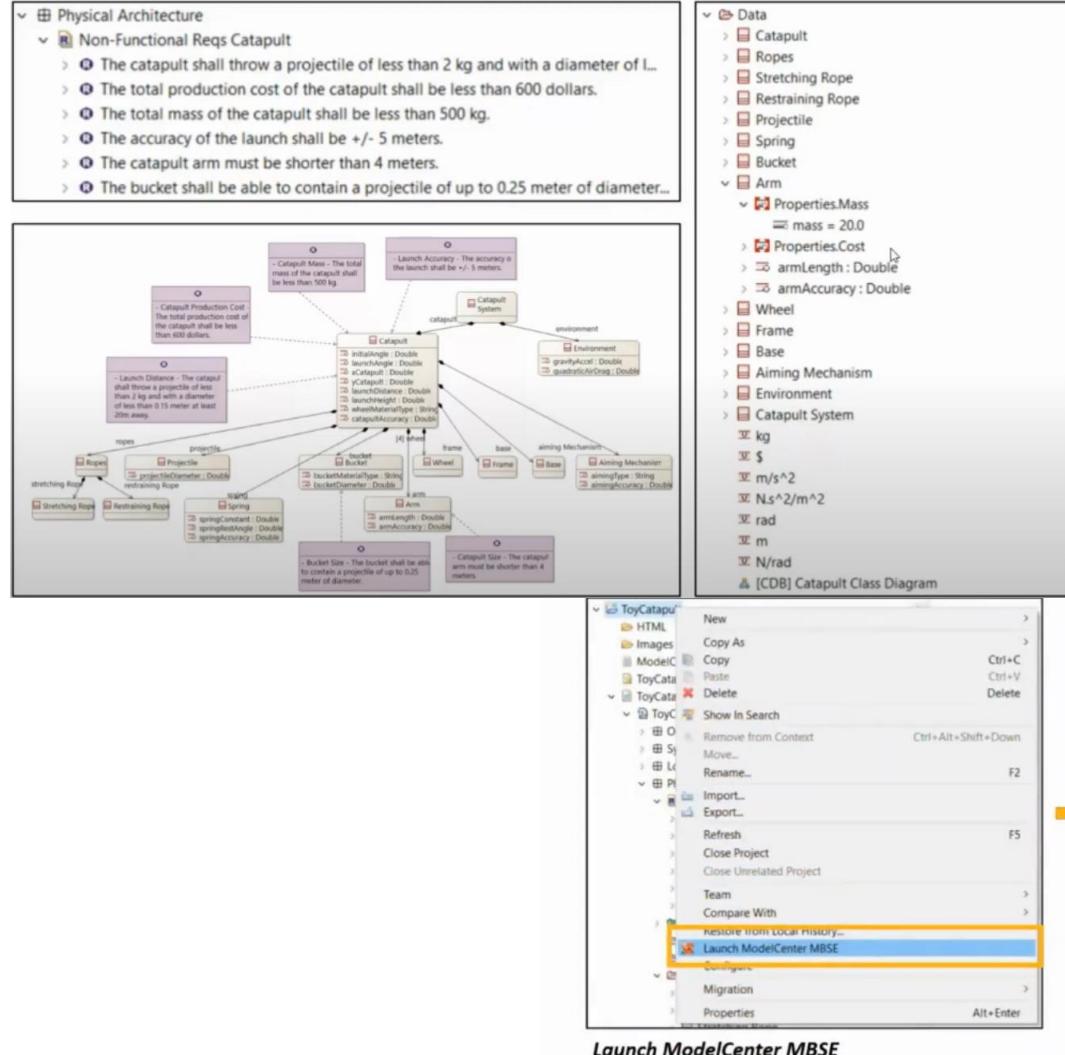

How to select the best arrangement to satisfy the requirements of the beamline experiment? With Model Center, it is possible to simulate, based on the same input parameters, different models and/or scenarios and study their respective outputs.

# Ansys Model Center

## Capella integration

WEBINAR

## Connecting Capella and ModelCenter to Analyze System Architecture

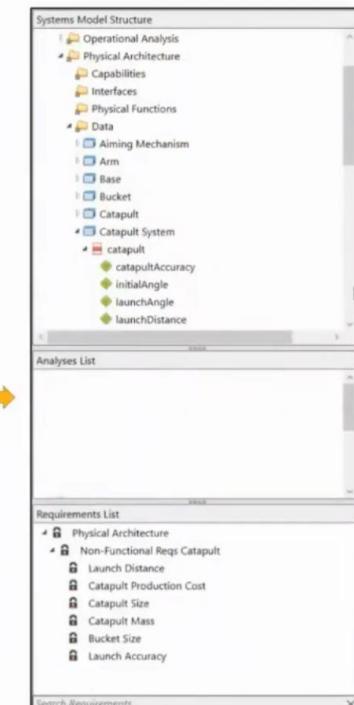

**Alexandre LUC**  
Senior Application Engineer at Ansys

**Scott RAGON**  
Principal Product Manager at Ansys

eclipse.org/capella

Our application is based on the “Connecting Capella and ModelCenter To analyse System Architecture” Capella Webinar, available on Obeo’s website and on Youtube at the Eclipse Capella channel.

Last, but not least...

# Conclusions

- While trying to develop a tailored system engineering application, we value most finding the right tool for each job than developing a tool for each job.
- Capella's wide range of third part integration has been crucial to developing an as seamless as possible multi-software flow.

# Thank you!
